| INTRODUCTION .....                                                                                          | 1  |
| <i>Introduction to the General Social Survey (GSS)</i> .....                                                | 1  |
| <i>Introduction to the International Social Survey Programme (ISSP)</i> .....                               | 2  |
| <i>Study Overview</i> .....                                                                                 | 3  |
| Table 1: Key Aspects of the 2024 GSS Cross-section.....                                                     | 4  |
| <i>Datafile Overview</i> .....                                                                              | 5  |
| NOTE ON MEASUREMENT AND INTERPRETATION .....                                                                | 6  |
| <i>Total Survey Error Perspective for GSS Trend Estimates</i> .....                                         | 6  |
| DESIGN GOALS OF THE 2018-2024 GSS AND TRANSITION EXPERIMENTS.....                                           | 8  |
| DESIGN OF THE 2024 GSS CROSS-SECTION .....                                                                  | 10 |
| <i>Summary of major changes</i> .....                                                                       | 10 |
| Multimode Experimental Design (Contact Protocol and Survey Mode) .....                                      | 10 |
| Respondent Selection.....                                                                                   | 11 |
| GSS-ANES Collaboration.....                                                                                 | 11 |
| Figure 1: The 2024 GSS Cross-section and Follow-on Studies Design.....                                      | 13 |
| Oversample.....                                                                                             | 13 |
| NOTES ON THE WEB MODE IN THE 2024 GSS .....                                                                 | 14 |
| Web Mode Wording Changes .....                                                                              | 14 |
| Don't Know and No Answer Responses.....                                                                     | 14 |
| SEX .....                                                                                                   | 15 |
| Optimization of Items for Web Mode .....                                                                    | 15 |
| Screenshots of Changes.....                                                                                 | 15 |
| Figure 2: Visual Display of a Survey Question in the 2024 GSS Cross-section web mode.....                   | 16 |
| USEFUL NOTES FOR WORKING WITH THE 2024 GSS CROSS-SECTION .....                                              | 17 |
| <i>Geography</i> .....                                                                                      | 17 |
| <i>Household Enumeration Form (HEF)/Household Composition</i> .....                                         | 17 |
| Table 2: Guide to the Respondent Selection, traditional and experimental Household Composition Modules..... | 18 |
| <i>Industry and Occupation (I/O)</i> .....                                                                  | 19 |
| <i>Spouse vs. Co-habiting Partner</i> .....                                                                 | 19 |
| <i>FAMILY16 and MA-/PA- Series</i> .....                                                                    | 20 |
| <i>Paradata</i> .....                                                                                       | 20 |
| Pre-interview .....                                                                                         | 20 |
| Mid-interview .....                                                                                         | 20 |
| Post-interview.....                                                                                         | 21 |
| Other Sources of Paradata .....                                                                             | 21 |

|                                                                        |           |

## INTRODUCTION

### Introduction to the General Social Survey (GSS)

The General Social Survey (formerly, General Social Surveys) is a series of nationally representative cross-sectional interviews in the United States that have occurred since 1972. The GSS collects data on contemporary American society to monitor and explain trends in opinions, attitudes, and behaviors. The GSS has adapted questions from earlier surveys, thereby allowing researchers to conduct comparisons for up to 80 years. Originally proposed and developed by James A. Davis, the GSS has been administered by NORC at the University of Chicago (NORC) and funded by the National Science Foundation (NSF) since its inception. Currently, the GSS is designed by a set of Primary Investigators (PIs), with input from the GSS Scientific Advisory Board, comprised of notable researchers within the scientific community.

The GSS contains a standard core of demographic, behavioral, and attitudinal questions, plus topics of special interest. Among the topics covered are civil liberties, crime and violence, intergroup tolerance, morality, national spending priorities, psychological well-being, social mobility, and stress and traumatic events. Altogether, the GSS is the single best source for sociological and attitudinal trend data covering the United States. It allows researchers to examine the structure and functioning of society in general, as well as the role played by relevant subgroups and to compare the United States to other nations. The GSS aims to make high-quality data easily accessible to scholars, students, policymakers, and others, with minimal cost and waiting.

The GSS has been tracking trends in public opinion since 1972. Throughout, the GSS has taken great care to keep the survey methodology as comparable over time as possible, which includes everything from keeping the same sampling approach to not changing question wording. This is done to minimize potential changes due to changes in methodology and support the study of trends in public opinion in the United States over time. However, due to the global COVID19 pandemic, the 2021 GSS Cross-section implemented significant methodological adaptations for the safety of respondents and interviewers, most notably shifting to an address-based sampling with push to web and a web self-administered questionnaire. Following this change, subsequent rounds of the GSS (2022 and 2024) bridge the traditional face-to-face data collection of the GSS from 1972-2018 with the web-based collection of 2021, keeping many of the questionnaire changes brought about by the new mode, while reverting to a mixed mode data collection that include face to face, web and telephone. The current GSS design (the 2022 and 2024 rounds) is meant to facilitate a comparison to the 1972-2018 GSS; that is, the 2022 and 2024 studies aimed to resemble the 1972-2018 GSS. Additionally, the 2024 GSS retained several methodological experiments conducted in the 2021 GSS that are specific to the web mode. The 2024 GSS is the second round of a multi-round transition to a mixed-mode survey, fielded both face-to-face and via web self-administered questionnaire.

In 2024, as in 2022, the GSS conducted a methodological experiment to (1) help bridge the 2018 and 2021 data with future rounds of the GSS and (2) to help rein in growing costs associated with conducting the more traditional in person field study. The experiment divided the 2024 GSS sample into two conditions. The first condition contacted sampled households for an in-person field interview first (as has been traditionally done in the GSS) and then nonrespondents were encouraged to take the survey using a web alternative. In the second condition, sampled households were presented with a web survey first and then nonrespondents were approached to participate in an in-person field interview. Details on this experiment are below but the overall goal of the experiment was to allow analysts to be able to parse out selection into mode differences from potential effects of the mode the survey was completed in. For more information, see [DESIGN GOALS OF THE 2018-2024 GSS AND TRANSITION EXPERIMENTS](#).

The GSS comprises a core set of items (the Replicating Core) that are repeated every round, as well as topical modules, which may or may not be repeated. The GSS is currently composed of three separate ballots (A, B, and C), as well as two separate forms (X and Y), which allow for up to six different paths through the interview itself (in addition to paths determined by respondent answers, such as questions about spouses or partners, or questions on employment). Not every question in the Replicating Core is asked of every respondent; most only appear on two of the three ballots. However, every item in the Replicating Core overlaps on at least one ballot with every other item in the Replicating Core, ensuring that researchers can estimate inter-item correlations. Forms are used for experiments such as wording variations within questions, ensuring that half of the respondents on each ballot see the experimental or control conditions of each relevant variable. Within the GSS, these form experiments are usually assigned mnemonics that end in -X or -Y, corresponding to FORM (i.e., 1 and 2).

Topical modules are typically assigned to either two full ballots (e.g., A and B) or one full ballot and one half-ballot (e.g., A and BX), covering two-thirds or half of sample respondents, respectively. However, some topical modules are included on all ballots. Modules are usually assigned to specific ballots based on one of two conditions: overlap with other key questions (either ensuring that respondents to specific items also receive specific modules or that respondents to specific items *do not* receive specific modules), or time constraints. The GSS tries to balance the length of all six paths to be approximately equal. Topical modules may be administered via interviewer in any mode or completed by self-administered questionnaire, depending on the sensitivity of the items included.

Topical modules come from several different sources. While the GSS broadly is funded by NSF, individual modules may be sponsored by other government agencies, universities, research institutes, or individuals. The GSS typically includes modules every round that are related to the *International Social Survey Programme* ([ISSP](#)), a consortium of national-level studies like the GSS (for more information, see *Introduction to the International Social Survey Programme*, below). Finally, modules may be solicited by the GSS Scientific Advisory Board or the Principal Investigators and can be included based on scientific merits and available time in the interview. The number of GSS modules varies by year.

Additionally, the GSS has implemented experimental designs over time or through collaborations (for instance, supporting other studies such as the National Organization Studies, National Congregations Study, National Voluntary Associations Study, and the 2016-2020 General Social Survey-American National Election Studies (GSS-ANES) Panel), which have led to several ancillary datasets.

## Introduction to the International Social Survey Programme (ISSP)

The ISSP is a consortium of nationally representative research studies, like the GSS, who have all agreed to ask questions on the same topics on an annual basis. It emerged out of bilateral collaboration with NORC and the German organization Zentrum für Umfragen, Methoden, und Analysen (ZUMA; now part of GESIS-Leibniz Institute of the Social Sciences). Starting in 1982, each organization devoted a small segment of their national surveys, ALLBUS and GSS, to a common set of questions. The ISSP was formally established in 1984 by Australia, Germany, Great Britain, and the United States, and it now has 45 member countries across five continents and has collected data in 70 countries. NORC represents the United States as a country in the ISSP.

ISSP modules have several defining criteria:

- Modules are developed in English and translated to every administered language.
- Modules must contain approximately 60 questions and can be supplemented by optional items, as well as around 40 items on background and demographic characteristics.

- Modules must contain the same items across all languages and studies, asked in the same order, with minor variations to account for mode differences or regional differences.<sup>1</sup>
- Each topical module must be administered within a relatively narrow time frame, usually about 18 months from the start of the relevant year.

ISSP Modules are currently replicated every 10 years, allowing for topics to be studied as both a multinational snapshot at a single point in time as well as a slowly evolving repeated cross-section of national opinions. While not every topic is repeated, the longest-running module is up to its fifth replication. ISSP rules require that when a topic is repeated, at least two-thirds of the questions must be repeated from a previous round, while up to one-third can be new questions.

For a list of topics included in the ISSP since 1985, please consult: <https://issp.org/data-download/by-year/>

## Study Overview

This codebook focuses on the 2024 GSS Cross-section survey. While this iteration of the Cross-section has meaningful changes from previous editions, there is much that remains consistent. Just as was done since 2004, the GSS Cross-section survey administers a full-probability sample approach with samples created from an adapted form of the United States Postal Service (USPS) metropolitan statistical area (MSA)/county frame area. More on the GSS conventional design can be found on pages 3177–3178 of the legacy cumulative codebook, available at the GSS website.<sup>2</sup>

The GSS has been conducted since 1972 and currently functions as a social indicators program, which highly values historical trends and continuity. To that end, the GSS's replicating core contains items that have been asked since its inception. In some cases, these items were asked on even older surveys, allowing for continuous measurement of concepts since the 1940s.

GSS variables appear at three different frequencies. Items in the Replicating Core, Household Composition, and Contact/Validation typically appear every year and are rarely altered (although, in 2024, they feature modification for the web mode). Items in some topical modules, such as ISSP modules, can appear in multiple years, but not every year. Finally, items on the rest of the topical modules typically only appear in a single year. In the 2024 GSS, the ISSP National Identity and Citizenship, Mental Health Stigma and High-Risk Behaviors modules are repeats from previous years. It is important to note that important updates to questions were made to these modules.

In addition, some respondents were invited to participate in a follow-on study in conjunction with the American National Election Studies (ANES). For more information on this follow-on module, please see [GSS-ANES Collaboration](#).

The 2024 GSS Cross-section includes the following Topical Modules (some of which include updates and modifications to previously fielded modules):

- *American National Election Studies*: In the 2024 GSS, the American National Election Studies (ANES) questions were included for the first time in the cross-sectional questionnaire. It focuses on voting behaviors and attitudes and opinions about politics, government, and the economy.
- *ISSP National Identity and Citizenship*: This module combines two previous ISSP modules: National Identity (1995, 2003, 2013) and Citizenship (2004, 2014). It focuses on ways of belonging to and participating in civic life in order to belong to a nation, or act as a good citizen. As it combines two previous ISSP modules, five-sixths of the items are repeated from previous rounds, while one-sixth are new.

<sup>1</sup> For example, asking about Congress or Parliament, or asking about the European Union or NAFTA.

<sup>2</sup> [https://gss.norc.umd.edu/content/dam/gss/get-documentation/pdf/codebook/GSS\\_Codebook.zip](https://gss.norc.umd.edu/content/dam/gss/get-documentation/pdf/codebook/GSS_Codebook.zip)

- *ISSP Digital Societies*: This is the first time this module has been conducted. It focuses on attitudes and opinions on internet use and attitudes and opinions about technology and media usage.
- *Mental Health Stigma (Adult)*: This module has previously been asked three times, beginning in 1996. It contains two parts; a vignette about a hypothetical person suffering from some sort of problem, and a series of questions about what the respondent thinks that person should do. The vignettes included are randomized by sex, race, education, and condition. The module also includes several questions on individual mental health. This module was originally proposed by Bernice Pescosolido and Alejandra Capshaw at Indiana University Bloomington.
- *Mental Health Stigma (Child)*: This module has been previously asked in 2002. It contains two parts: a vignette about a hypothetical child suffering from sort of problem, and a series of questions about what the respondent thinks the child should do. The vignettes included are randomized by race, sex, and age, as well as condition. The module also includes several questions on respondent mental health, as well as respondent family background. This module was originally proposed by Bernice Pescosolido and Alejandra Capshaw at Indiana University Bloomington.
- *High-Risk Behaviors*: High-Risk Behaviors, developed by the Centers for Disease Control and Prevention (CDC), is a self-administered module that has been in use with modifications since 1988. It includes items on recent sexual history as well as sexual history since the age of 18, as well as drug use, HIV testing, and sexuality. This module has been substantially redesigned in 2024, and also includes a new set of questions on self-reported perceptions of the male/female dichotomy designed by Aliya Saperstein at Stanford University.

*Table 1: Key Aspects of the 2024 GSS Cross-section*

| Key Aspect                            | 2024 GSS Cross-section                                                                                                                                                                                                                    |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sample                                | Adults 18 or older in the United States who live in noninstitutional housing at the time of interviewing                                                                                                                                  |
| Invitation                            | Mailing materials that show a web link to invite people to participate on the web (i.e., pushing respondent to a web survey first) or informed respondents that in-person interviewers would arrive soon. Phone option was also provided. |
| Survey mode                           | Face-to-face (34.7%) and web (54.5%), supplemented by phone (7.6%) and multimode (3.3%) <sup>3</sup>                                                                                                                                      |
| Incentive                             | Both non-contingent pre-paid incentive and contingent post-paid incentive                                                                                                                                                                 |
| Final sample size                     | 3,309 completes from 13,900 lines of sample.                                                                                                                                                                                              |
| Response Rate (AAPOR RR3)             | 44.6%                                                                                                                                                                                                                                     |
| Fielding period                       | April 3, 2024 to December 2, 2024                                                                                                                                                                                                         |
| Administration                        | Mail push to web and in person interviewing as primary modes, supplemented with phone                                                                                                                                                     |
| Respondent selection within household | Kish without age ordering                                                                                                                                                                                                                 |
| Language                              | English and Spanish                                                                                                                                                                                                                       |
| Paradata derived from instrument      | Paradata is available in a file separate from the cumulative datafile.                                                                                                                                                                    |

<sup>3</sup> All percentages weighted using WTSSPS.

Occasionally, the cumulative datafile is updated with newly cleaned or derived variables, and error corrections. Please see [Release Notes](#) for changes since the initial release of the 1972-2024 Cumulative file and [Log of Suspected Issues](#) for potential changes in the future.

## Datafile Overview

Available datafiles for the 2024 GSS include:

- GSS 1972-2024 Cross-Sectional Cumulative Data (Release 1, May 2025) in [Stata](#), [SPSS](#), and [SAS](#)
- Individual Year Data for the 2024 GSS in [Stata](#), [SPSS](#), and [SAS](#)
- Customized data extracts in Stata, SAS, and SPSS created using the [GSS Data Explorer](#)

The SPSS version of the GSS data is available for Release 1 of the 2024 data after a hiatus in 2021 and 2022. However, the missing values have been updated since the last SPSS datafile release (1972-2018 Cumulative data file) to be consistent with the expanded list of missing values used in Stata and SAS. The new missing values make use of discrete negative values which are consistent with the missing values used in the [GSS Data Explorer](#) as well as with the File Extraction feature of the GSS Data Explorer to get a SPSS-formatted data file. For more details, please see [RESERVE CODES AND MISSING VALUES](#).

In rare occasions, GSS uses decimal values for response categories. Due to a limitation of Stata, labels cannot be assigned to those decimal values. The following variables and values are impacted in the Stata-formatted GSS data file:

- Variable FILEVERSION
  - 7224.1: GSS 1972-2024 Release 1 (May 2025)
- Variable YEARSJOB
  - 0.25: Less than 6 months
  - 0.75: 6-11.9 months
- Variable SUBSAMPRATE
  - 0.2: 20% Subsampling Rate
  - 0.3: 30% Subsampling Rate
  - 0.4: 40% Subsampling Rate
  - 0.5: 50% Subsampling Rate
  - 1.0: 100% Subsampling Rate

## NOTE ON MEASUREMENT AND INTERPRETATION

The GSS has been tracking trends in public opinion since 1972. Over this time, the GSS has taken great care to keep the survey methodology as comparable over time as possible, which includes everything from maintaining the same sampling approach to not changing question wording. This is done to minimize potential changes due to methodology and to support the study of changes in public opinion in the United States.

In 2024 the GSS replicated a methodological experiment implemented in the 2022 GSS. The purpose of the experiment was to 1) help bridge the 2018 and 2021 data with future rounds of the GSS, and 2) to address growing costs associated with conducting an in-person field study. The experiment divided the 2024 GSS sample into two conditions. The first condition contacted sampled households for an in-person field interview first (as has been traditionally done in the GSS) and then nonrespondents were offered a web option. In the second condition, sampled households were presented with a web survey first and then nonrespondents were approached to participate in an in-person field interview. Details on this experiment are below, but the overall goal of the experiment was to allow analysts to be able to parse out experimental allocation into data collection approaches. While the 2024 GSS experiment was not set up to directly compare modes (instead, it was set up to compare data collection approaches), users are encouraged to check for mode sensitivities, comparing cases completed in different modes. The current release does not include mode-specific statistical weights; thus, mode-specific inferential statistics are not currently supported. Future GSS are expected to release mode-specific weights to support population inferences. This release includes weights intended for all cases to support population inferences.

### Total Survey Error Perspective for GSS Trend Estimates

When evaluating the GSS for trend changes over time, we caution our users to carefully consider changes in the GSS methodology from a total survey error perspective. Total survey error is a way of comprehending the impact on estimates due to measurement, non-response, coverage, and sampling error. Below, we provide a high-level summary of the components of the total survey error and how they could impact trend comparisons – especially between 2018 and the present.

**Measurement Error:** Changes in how survey questions were administered can impact the answers. The GSS has traditionally been conducted in person and administered by an interviewer. In 2021, due to the COVID-19 pandemic, the GSS needed to administer survey questions primarily over the web without any interviewer assistance. Some changes were needed in the measures, due to mode of administration. For example, “Don’t Know” response categories were included for factual questions, but they were not displayed for opinion questions. In the past, “Don’t Know” responses could be recorded by interviewers regardless of whether they were factual or opinion questions. In 2022 and 2024, these modifications were also present in the web mode, while the face-to-face mode used measures as they were designed for the 2018 GSS. These changes in measurement can be evaluated using the 2024 experimental data which combines in-person, web and telephone administration.

**Non-response Error:** Historically, the GSS has achieved high response rates well above 50 percent, mostly because in-person surveys can attain higher response rates. The 2024 GSS response rate was 44.6 percent. In addition, the 2024 GSS continues to generate post-stratification raking weights for the GSS survey cumulative file from 1972–present to attempt to reduce potential non-response error differences over time as response rates in surveys have declined.

**Coverage Error:** Coverage error can arise from how well adults living in selected households are enumerated to represent the general adult population. If a household enumeration method adopted in a survey consistently

misses eligible household members (e.g., roommates or borders), it can result in coverage error (under-coverage). And over-coverage can result if an ineligible person (someone living in a college dorm or someone living in an assisted living facility) or the same person is counted in more than one household. In 2024, an adult living in the household was asked to list all adults living in the household and provide names and ages (as a categorical range) for each adult. This roster was then used to randomly select the respondent for each household, determined by Kish number and position of the adult on the household roster. The GSS team is actively conducting research to assess the impact of household enumeration and selection methods to achieve adequate coverage of the US adult population.

**Sampling Error:** The 2024 GSS Cross-section relies on scientific sampling to allow for the calculation of sampling error (i.e., margin of error). As in any scientific sample, any one trend from year to year can be impacted by the fact we only observed a sample and not the entire population. The dataset contains survey design variables (clusters, strata, and weights) to account for the complex survey sample design. And it is possible that our trend estimates are off by a sampling or “margin of error” between any given set of years. It is essential, therefore, to control for sampling error by conducting tests of significance for trend differences estimates.

**Mode:** GSS data users should use caution when analyzing any variables by mode of survey (MODE). Basic mode analyses may find differences between individual modes; however, the weights included in the current release do not support single-mode analyses. The current weights are provided to support inferential statistics using all cases. (The GSS team is working on developing mode specific weights for future data releases.) While observed differences between modes may suggest mode sensitivities, these are not true “mode effects.” The mode of completion for a respondent is determined by a number of factors, including the modes available to the respondent, the mode initially assigned to a household (see [Mode Assignment and Non-response Follow-up Experiment](#)), the use of nonresponse follow-up approaches, and measurement differences related to different modes.

We recommend our users include one of the following statements when reporting on the GSS 2021, 2022, and 2024 Cross-section data:

**Total Survey Error Summary Perspective for the GSS Cross-section:**

Changes in opinions, attitudes, and behaviors observed in 2021, 2022, and 2024 relative to historical trends may be due to actual change in concept over time and/or may have resulted from methodological changes made to the survey methodology during the COVID-19 global pandemic.

**Suggested Statement to Include in Articles and Reports That Use GSS Data**

Changes in opinions, attitudes, and behaviors observed in 2021, 2022 and 2024 relative to historical trends may be due to actual change in concept over time and/or may have resulted from methodological changes made to the survey methodology during the COVID-19 global pandemic. Research and interpretation done using the 2021, 2022, and 2024 GSS data should take extra care to ensure the analysis reflects actual changes in public opinion and is not unduly influenced by the change in data collection methods. For more information on the 2021, 2022, and 2024 GSS methodology and its implications, please visit <https://gss.norc.org/Get-The-Data>.

## DESIGN GOALS OF THE 2018-2024 GSS AND TRANSITION EXPERIMENTS

The 2022 and 2024 rounds of the GSS were proposed with a well-understood experimental design that would aid in the transition from a traditional face-to-face data collection to a multimode study employing modern data collection tools and cost-effective approaches. This design made the 2022 and 2024 rounds of GSS data collection more efficient and offered respondents more flexibility in how they preferred to complete the survey.

These changes come in the wake of the 2021 GSS Cross-section, which was fielded primarily via a web self-administered questionnaire. At the time, the web-based data collection was the only way that NORC could ensure the safety of all respondents and project staff, due to the COVID-19 pandemic. Changes in trends from the 2021 GSS Cross-section could have several potential sources, including both mode effects and genuine social change, with no clear way to disentangle those effects beyond specific item-level experiments on the survey (see the volunteered response and grid experiments for more information).

The 2022 and 2024 rounds of the GSS conducted a methodological experiment to: 1) help enumerate potential mode effects to bridge the 2018 and 2021 data with future rounds of the GSS, and 2) to address growing costs associated with conducting an in-person field study. The experiment divided the 2022 and 2024 GSS samples into two conditions. The first condition contacted sampled households for an in-person field interview first (as has been traditionally done in the GSS) and then nonrespondents were offered a web option. In the second condition, sampled households were presented with a web survey first and then nonrespondents were approached to participate in an in-person field interview. Details on this experiment are described below, but the overall goal of the experiment was to allow analysts the ability to parse out selection into mode differences from potential effects of the mode the survey was completed in.

The 2022 and 2024 GSS Cross-sections bridge the traditional face-to-face data collection of the GSS from 1972–2018 with the web-based collection of 2021, keeping many of the questionnaire changes brought about by the new mode, while reverting to a four-stage cluster sample for both the web and face-to-face modes of data collection. The 2022 and 2024 GSS, thus, resemble both the 2018 GSS (in terms of sampling strategy and respondent selection) and the 2021 GSS (in terms of questionnaire design and certain experiments). The 2022 and 2024 GSS represent the first round of a multi-round transition to a mixed-mode survey, fielded both face-to-face and via web self-administered questionnaire.

The 2022 and 2024 GSS, however, reverse some of those changes, most notably by providing an option for face-to-face data collection. In this manner, the 2022 and 2024 GSS allow researchers to bridge the 2018–2022 GSS rounds, by providing comparisons with the face-to-face data from 2018 as well as with the web self-administered data from 2021. The 2022 and 2024 data, in essence, are essential for understanding both the 2018 and 2021 rounds of the GSS. NORC recognizes this fact, and feels it is important to release these data to the public as early as possible, in this preliminary release format. Changes in trends, especially in variables that show sensitivity to mode of administration, were anticipated and are not a cause for concern. Sensitivity to mode has been present in the GSS data since the start – as well as a feature of all other survey data. The 2022 and 2024 GSS changed the design to be able to, for the first time, enumerate the mode effects associated with the primary face to face design the GSS had employed since 1972. The experiment was carefully designed to be able to estimate the mode effects and allow for harmonized time series to be created for 1972–2024.

Finally, while some degree of mode sensitivity was expected, NORC could not be certain in advance which variables might show mode sensitivity and require further analysis. The only way to fully understand and control for these mode sensitivities is to collect and work with the data, and NORC recognizes that we are only one part of the full GSS community. To that end, we are releasing the data, including mode-sensitive variables, so that the community of researchers and scientists involved with the GSS can also understand the scale and breadth of

potential issues, and work with NORC to develop a strong shared understanding of the issues and how best to present them to the general public. Decisions like these should be made in collaborative environments, rather than solely under NORC's purview, and the data release represents the first step of that process.

Based on the results from an analysis of the 2022 mode assignment experiment, the two mode sequences produced similar estimates in relation to both demographic composition and substantive measures. The response rates of both experimental conditions were also comparable, but the web-first design resulted in greater cost savings, only due in part to the subsampling used for in-person follow-up. The results suggest the power in utilizing multimode designs even if the timing and offering of modes may differ. Additional details regarding the results of the experiment are available in [GSS Methodological Report 140](#).

## DESIGN OF THE 2024 GSS CROSS-SECTION

The GSS implemented a methodological experiment in the 2024 Cross-section survey (similar to the 2022 Cross-section survey), which is different compared with previous GSS Cross-section studies. The methods experiment relates to shifts in the mode of data collection, and this section explains the experiment in detail. Most notably, the 2024 GSS Cross-section is a multimode study, with respondents assigned to one of two conditions — a face-to-face interview first (followed by a self-administered web survey for nonrespondents), or a web self-administered questionnaire first (followed by a face-to-face interview for nonrespondents). The 2024 design is a replication of the 2022 GSS Cross-section design.

### Summary of major changes

There are several major methodological changes in the 2024 GSS Cross-section:

**Contact protocol:** The 2024 GSS Cross-section used an experimental multimode design, allowing for a mail push-to-web respondent methodology in addition to in-person visits to collect data.

**Respondent selection:** The 2024 GSS Cross-section uses a modified respondent selection procedure of rostering all adults in the household and respondent selection via the Kish grid.

**Survey mode:** The 2024 GSS Cross-section uses the in person face-to-face interview, telephone interview, and self-administered as a part of the multimode design.

**Follow-on Studies:** The 2024 GSS Cross-section included one follow-on study which eligible respondents could complete. This follow-on was in collaboration with the American National Election Studies.

**Oversample:** In addition to the nationally representative sample, the 2024 GSS Cross-section includes an oversample of Black, Hispanic, and Asian, Native Hawaiian, and Pacific Islander (AANHPI) respondents, obtained from the NORC AmeriSpeak® Panel, which utilizes the same national sampling frame as the GSS. These respondents were not eligible for the follow-on studies. These cases will be included in a future release of the single-year file.

**Each of these changes has consequences for the 2024 GSS Cross-section. These changes are discussed below.**

### *Multimode Experimental Design (Contact Protocol and Survey Mode)*

To accomplish data collection during the COVID-19 pandemic, the 2021 GSS implemented a mail push-to-web methodology in-place of a face-to-face interview (supplemented by a small number of telephone interviews) given health and safety concerns for both field interviewers and respondents. With pandemic conditions improving into 2022, the GSS desired to scientifically evaluate the addition of web as a new mode of data collection to help supplement traditional face-to-face interviews to reduce costs, increase sample sizes, and improve data quality. We wanted to explore the web mode while preserving the primary mode of data collection, face-to-face interviewing. To do this we introduced an experimental multimode design to explore whether we could realize cost

savings while providing respondents with a mode that best meets their needs and helps achieve a high response rate.

The 2024 GSS allowed data collection in three modes: face-to-face interviewing, web survey, and telephone interviewing. More than 96 percent of respondents completed in a single data collection mode, while the remaining completed in two or more modes. The variable MODE tracks the mode of survey completion, while MODESEQUENCE tracks the initial mode of survey assignment. Specific mode checks throughout the interview will be included in the paradata file.

To evaluate differential multimode designs, NORC conducted a multimode experiment randomly assigning sample cases to one of two multimode sequences: (1) face-to-face with a push-to-web non-response follow-up and (2) mail push-to-web with a face-to-face non-response follow-up (with both conditions using telephone methods to encourage participation and supplement data collection). Both conditions were administered concurrently allowing us to scientifically compare the two conditions. More details on this experiment are available in [Mode Assignment and Non-response Follow-up Experiment](#).

## Respondent Selection

In previous rounds of the GSS, respondents were selected via quota (1972-1976), Kish grid with age ordering (1975-2018), last birthday (2021), or Kish grid without age ordering (2022). The 2024 GSS cross-section implemented the Kish grid without age ordering, where the positions of adults in the household for the Kish grid are determined by their order in the household roster, not their age. This change is the result of two major developments. First, the GSS team, alongside experts in the field, uncovered correlations between Kish assignment and assignment of ballot and form in the 2010, 2012, 2016, and 2018 GSS Cross-sections (see [GSS Methodological Report 134](#) for more details), which were in part exacerbated by the age ordering effects. Second, the GSS shifted the administration of the household enumeration form from a paper copy to a digital one. As a result, programmatic selection rather than interviewer-aided rostering was used for identification of the within-household respondents. Age ordering was previously used on paper household rosters to control for interviewer influence on respondent selection i.e. potentially manipulating the order of the household roster to select a more willing or eager respondent within the household. The age ordering of the household roster was a visible control against such possibilities, but without a visible Kish grid assignment, such precautions were no longer necessary.

## GSS-ANES Collaboration

The 2024 GSS includes a collaboration between the GSS and the American National Election Studies (ANES). The 2024 GSS Cross-section includes a module of items proposed by the ANES team, including attitudinal questions, feeling thermometers for presidential candidates and parties, and plans for voting in the 2024 presidential election. All respondents completed the ANES topical module on the 2024 GSS, although some questions were removed for respondents who were not U.S. citizens or not in the process of becoming U.S. citizens.

The individual feeling thermometer items (RATEINCUMB, RATECHALL1, RATECHALL2, RATECHALL3) were asked in a random order, followed by the party-level feeling thermometer items (RATEDEMP, RATEREPP, RATEMAGA) in a random order. For the items ECONSTAT, POLINTRST, DEMSTAT, and VOTEPROB, respondents on FORM X received the response categories as presented in this codebook, while respondents on FORM Y received the response categories in reversed order.

The GSS includes two different versions of several variables in the ANES module, intended to make future analysis of the data easier. Items which end with "TS" have been supplied with generic labels, identifying only the party or position of the subject, allowing for a more easily observable time-series, based on future rounds. These items will also be retroactively created for the 2016-2020 Panel, which contains the 2020 GSS-ANES collaboration. Items

which end with "24" contain the year-specific labels and reflect how the item was actually asked on the questionnaire. For example, RATEINCUMBTS tracks the rating of the incumbent president, regardless of who the president is, while RATEINCUMB24 tracks the rating of Joe Biden in the year 2024.

Eligible respondents who completed the 2024 GSS baseline survey were then invited to participate in the ANES pre-election panel. Eligibility was determined by two criteria: 1) current U.S. citizenship, and 2) completion of the ANES module of the GSS interview prior to Joe Biden dropping out of the presidential race. This occurred at approximately 1:45 pm Eastern Time on July 21, 2024. On Wednesday, July 24, the WHOVOTE24 item in the GSS interview was updated to WHOVOTE24A, replacing Joe Biden's name with Kamala Harris. Respondents to the 2024 GSS will only have a valid response to either WHOVOTE24 or WHOVOTE24A, but not both items. No other changes were made to the ANES module at this time, as Kamala Harris' name was already present in the feeling thermometer questions. 1,533 GSS respondents met these two criteria and were contacted to complete the ANES pre-election survey.

The ANES pre-election survey was fielded to GSS respondents from August 13, 2024 through November 4, 2024. A total of 1,533 GSS respondents were invited to participate, and 985 completed the pre-election survey, with a further 34 partial cases, for a total of 1,019 cases. These respondents appear in both the ANES pre-election study and the 2024 GSS cross-section.

The ANES post-election survey was fielded to GSS respondents from November 14, 2024 through January 23, 2025. A total of 985 GSS respondents who completed the pre-election survey were invited to participate, and 781 completed the post-election survey, with a further 26 partial cases, for a total of 807 cases. These respondents appear in both the ANES post-election study and the 2024 GSS cross-section.

Researchers can link the relevant 2024 GSS cross-section cases with the ANES pre-election and post-election data using variables common to each dataset, which will be released later in 2025. The GSS will provide the relevant ANES identifying information in the variable ANESID.

Additional information on overlapping variables, including names in both studies, will be provided following the release of the ANES-GSS linking information later in 2025.

Additional information:

The ANES-GSS 2024 Joint Study was a collaboration between the General Social Survey and the American National Election Studies. The ANES is a collaboration between the University of Michigan and Stanford University. For the ANES-GSS 2024 Joint Study, GSS data collection was conducted by NORC at the University of Chicago, and ANES data collection was conducted by the Survey Research Center (SRC) at the University of Michigan.

The GSS-ANES collaboration was supported by the National Science Foundation, Grant #2209438, which runs from July 15, 2022 through June 30, 2026.

The sequence of follow-on studies can be seen in Figure 1 below:

Figure 1: The 2024 GSS Cross-section and Follow-on Studies Design

## Oversample

This round of data collection included an oversample of AmeriSpeak® panelists from key demographic groups. AmeriSpeak is a nationally representative panel of survey respondents from households across the United States created by NORC. Of invited panelists, the GSS aimed to complete 200 completes from three demographic groups: Black, Hispanic, and Asian, Native Hawaiian, or Pacific Islander (AANHPI) – for a total of 600 completed interviews. 3,419 panelists were invited to complete the full 2024 General Social Survey web-based survey and a total of 677 interviews were completed between September 2024 and November 2024. Panelists were randomized to various ballot and form combinations present on the GSS but were not invited to complete additional follow-on studies. These cases are not available in the preliminary (R1) release of the 2024 GSS but are expected in the complete (R2) release, expected in late summer 2025.

## NOTES ON THE WEB MODE IN THE 2024 GSS

### *Web Mode Wording Changes*

Since the 2024 GSS was conducted via a web-based questionnaire in addition to face-to-face, the study replicates all changes from the 2021 and 2022 GSS Cross-section's web mode design, rather than reverting to the 2018 face-to-face design. As a result, respondents encounter slightly different versions of items, depending on the mode in which they encounter the item. Web survey changes can come in many different forms but follow a few distinct operating principles. The changes are intended to:

- **Remove conversational language** in wording where it was no longer appropriate (e.g., using a more neutral “we” in the place of “I” and “me,” as referring to the interviewer in question stems).
- **Standardize terminology** where interviewers had chosen options as they saw fit (e.g., switching from “Blacks/African Americans” in the question stem to “Blacks” or “Black people,” depending on the question).
- Reword questions for items in which interviewers could **select appropriate language** according to information that they could observe but that was not yet recorded in the interview (e.g., reworking questions which used the term husband/wife prior to asking about the sex of the respondent's partner).
- Reword questions for items in which interviewers asked respondents **open-ended questions** but entered the responses in a combination of open-ended and closed-ended items. These changes were mostly confined to questions on Religion and Occupation/Industry.

Some of these changes, particularly the standardized terminology, also apply to the face-to-face instrument. The telephone instrument uses the same wording as the original face-to-face interview.

### *Don't Know and No Answer Responses*

In a face-to-face GSS interview, the interviewer does not show “Don't Know” and “No Answer” response options to respondents on hand cards or read those options to respondents. However, interviewers can code “Don't Know” or “No Answer” if a respondent did not wish to answer a question.

In keeping with this spirit, the GSS implemented a different design for “Don't Know” and “No Answer” responses in web mode to minimize the effect of making them visible to respondents on every item. The GSS web instrument made the following modifications for self-administration:

- **Removed all “No Answer”** response options, **instead letting respondents to skip questions** they did not wish to answer).
- **Removed all “Don't Know”** response options for **attitudinal questions**.
- Displayed **“Don't Know”** response options **in light-grey text**, separated from standard responses, on all factual questions.
- **“Don't Know”** responses were displayed for **factual items only**.

For all data collected via the web self-administered questionnaire mode, the GSS uses “Skipped on Web” code when a respondent skipped a question. These responses are separated from “No Answer,” which is used for the face-to-face and phone modes. The [2024 GSS Cross-section Public Use File Codebook](#) shows tabulations and response categories used in items across the 2024 GSS Cross-section. See Figure 2 for a screenshot example of an implementation of a “Don't Know” category.

An initial review of the 2024 data conducted by the NORC team during the production stage of the micro dataset indicates that there has not been a meaningful increase in “Don’t Know” responses with this rendering method. Rates of “Don’t Know” responses on factual items are consistent between phone and web modes. While certain items do show high levels of “Don’t Know” responses (e.g., income, information related to parental work), both modes typically show “Don’t Know” responses within a single percent of each other. However, this inspection should be considered preliminary. Users are encouraged to conduct their own analyses.

We invite users to assess levels of item non-response for factual questions measured in years past. In fact, while “Don’t Know” responses are typically within a percent of each other, the same may not be true for nearly every other substantive response on factual items. For example, in the 2024 GSS Cross-section, 43.4% of respondents in the face-to-face mode report that they are married, while 55.6% of respondents in the web mode report that they are married.<sup>4</sup> This may be due to mode preference, respondent composition, or mode effect. We urge caution in the interpretation of results between the two modes, as several hypotheses may explain these differences.

## SEX

In face-to-face interviews, interviewers traditionally coded SEX based on interviewer observation. For cases which were completed face-to-face or over the phone, observed sex is recorded as the variable SEX. In the web mode, SEX is not asked explicitly of respondents.

The GSS Cross-section collects sex through two separate items: sex recorded at birth (SEXBIRTH1) and self-reported sex (SEXNOW2). For the purpose of backward compatibility, the cross-section dataset contains SEX, SEXBIRTH1, and SEXNOW2. For web respondents, SEX is based on a recode of SEXBIRTH1 and SEXNOW2, and for other respondents, based on observation.

## Optimization of Items for Web Mode

GSS staff have made many other small changes to accommodate the web mode, including changing how items were presented to respondents visually by including buttons and colors for navigation, revising the sequence of certain items, and adjusting the response options for others. In addition, the full questionnaire was optimized for the most common web and smartphone browsers (Chrome, Safari, Firefox, Internet Explorer, Edge, and Opera), as well as various device types (desktop, laptop, tablet, and smartphone). These changes, along with the rewording changes, should not substantially affect how respondents answer questions and were mostly meant to minimize “Don’t Know” and “No Answer” responses. For a full account of all changes, please compare questionnaire documentation of the 2021 GSS Cross-section to previous iterations available on the GSS website.<sup>5</sup>

## Screenshots of Changes

The 2024 GSS Cross-section was fielded across a variety of modes, primarily face-to-face and web self-administered questionnaire. Figure 2 shows a typical item from this questionnaire displays both the typical layout of a self-administered web questionnaire item and the change to Don’t Know response options discussed in **Don’t Know and No Answer Responses**.

---

<sup>4</sup> Analysis conducted using WTSSPS as weight, limiting to baseline respondents who were not part of the AmeriSpeak oversample.

# USEFUL NOTES FOR WORKING WITH THE 2024 GSS CROSS-SECTION

## Geography

Data Release 1 of the 2024 GSS Cross-section includes the traditional geographic information for the GSS: XNORCSIZ, SRCBELT, and SIZE. However, the methodology used to generate these variables has changed slightly relative to previous releases of the GSS, due to a change in how these variables have been processed. Previously, respondent addresses were geographically located within Census tracts, and values were assigned for the entire tract based on the place or unincorporated area which contained the majority or plurality of the tract's inhabitants. In the 2024 GSS, respondents are assigned SIZE based on the place that intersects with their census tract. If their census tract intersects with multiple places, then they are assigned the place with the highest share of the tract's population calculated using census block population data. If the tract does not match a place, then SIZE is calculated using Census County Divisions (CCD). If the tract contains any incorporated place with a population larger than the CCD population, then that incorporated place is used in lieu of the unincorporated area. Otherwise, SIZE is set equal to the total population of the CCD minus the population of all incorporated places in the CCD.

## Household Enumeration Form (HEF)/Household Composition

For many years, the GSS has used the respondent selection process to roster all members of the household and any guests, and obtain additional information, including age (OLD1-14), sex (GENDER1-14), marital status if age 13 or older (MAR1-14), and information about their current presence in the household (AWAY1-14, WHERE1-14). In addition to this information, the respondent select process, also called the Household Enumeration Form (HEF), obtained information about the relationships between various household members, which were used to generate relationship-specific variables such as RELATE1-14 and RELSP1-14.

During the design of the 2020 GSS, NORC decided to split the functions of the HEF into two separate components, Respondent Selection and Household Composition. Respondent Selection uses a household informant, and rosters adults in the household to determine the eligible respondent for the GSS. Household Composition, meanwhile, is conducted as part of the interview, with the selected respondent. In the survey, it is located after the GSS Core. Household Composition re-rosters the household and collects the member-by-member information previously found in the HEF for all household members and guests. The GSS did not conduct face-to-face interviews in 2020 and 2021, so the new Respondent Selection instrument was first implemented in 2022. The revised Household Composition instrument was fielded as part of the 2021 GSS Cross-section.

From 2022 onwards, the GSS utilizes a fully redesigned Respondent Selection and Household Composition process. Respondent Selection and Household Composition are two independent components; Respondent Selection asked before the start of the survey, and Household Composition asked during the main survey, after the GSS Core. Because the household is not fully rostered for Respondent Selection, and is fully rostered for Household Composition, the source of several historical GSS variables has shifted, and new variables have been created to identify new sources of information. Respondent Selection contains much less information about the household, typically only the number of adults in the household (ADULTS) as well as their age and current presence in the household (AGEHEF1-14, AWAY1-14, WHERE1-14). The Household Composition section contains the remaining information, including for children under 18. Respondent Selection represents the household for the purposes of respondent selection, sampling, and weighting, while Household Composition attempts to represent the household as a sociological unit.

There are other notable changes in the split that resulted in separate Respondent Selection and Household Composition sections in the 2022 and 2024 GSS. First, there are separate and new variables for counts of people and adults in the household, such as in the split between HOMPOPH, the number of people in the household asked during the screening, and HOMPOP, the number of people in the household asked during the household survey module. Similarly, the same can be seen in the number of adults in household: ADULTS in Respondent Selection, and ADULTSINHH in the Household Composition module. There are also a few changes with informant and respondent identity within the roster. RESPNUMH has been created to identify the respondent's number in family when asked in the Respondent Selection, and RESPNUM reflects the Household Composition module. Last, HEFINFO1 is a new variable beginning with the 2022 GSS to reflect that the household informant will always be the first position of the family. HEFINFO is available for GSS years 2018 and earlier. No information on the household informant is available in 2021, as the 2021 GSS did not use a roster for respondent selection.

The 2024 GSS also included an experimental version of Household Composition designed to shorten the time of administration for household enumeration by collecting less detail on individual household members, while still gathering rich information on relationships in the household. This new module, also conducted in 2022, resulted in new household composition variables that include the suffix “\_exp” if they are similar to the Traditional Household Composition variable or have new mnemonics to represent a new questionnaire item. More information on the experimental household composition module can be found under [Household Composition in the GSS 2022 Codebook](#).

Table 2 includes a guide to commonalities across Respondent Selection, Household Composition, and the experimental Household Composition module. Variables with an asterisk (\*) are new as of 2022, such as all the Experimental Household Composition items, and are not available in previous years.

*Table 2: Guide to the Respondent Selection, traditional and experimental Household Composition Modules*

| Concept                                         | Respondent Selection              | Traditional Household Composition | Experimental Household Composition *             |
|-------------------------------------------------|-----------------------------------|-----------------------------------|--------------------------------------------------|
| Availability                                    | All cases                         | Form X only                       | Form Y only                                      |
| People in household                             | HOMPOPH*                          | HOMPOP                            | HOMPOP_EXP *                                     |
| Adults in household                             | ADULTS                            | ADULTSINHH*                       | ADULTS_EXP *                                     |
| Children in household                           |                                   | CHILDSINHH*                       | CHILDS_EXP *                                     |
| Age 0-6                                         |                                   | BABIES                            | BABIES_EXP *                                     |
| Age 7-12                                        |                                   | PRETEEN                           | PRETEEN_EXP *                                    |
| Age 13-17                                       |                                   | TEENS                             | TEENS_EXP *                                      |
| Presence of children                            |                                   |                                   | KIDSUND18 *                                      |
| Informant and respondent identity within roster | RESPNUMH*, HEFINFO1* <sup>6</sup> | RESPNUM                           |                                                  |
| Person-level characteristics                    | AGEHEF1-14, AWAY1-14, WHERE1-14   | OLD1-14, GENDER1-14, MAR1-14      |                                                  |

| Household Type    |                      | HHTYPE, HHTYPE1                        | HHTYPE1_EXP *                                                                                                                                                  |

Household Composition and Respondent Selection variables are not available in the preliminary (R1) release of the 2024 GSS, but are expected in the complete (R2) release, expected in late summer 2025.

## Industry and Occupation (I/O)

In the 2024 GSS, Industry and Occupation are captured through a series of open-ended questions, asking respondents first the name of their job, then what they do, followed by the name of their company, and a description of what the company does. This information, along with some other close-ended questions such as educational attainment, are utilized to generate the values for OCC10 and INDUS10 (as well as the SP-, CO-, MA- and PA- versions). NORC used the National Processing Center of the US Census Bureau to code occupation and industry from the open-ended text. Unlike previous rounds of the GSS, which relied upon NORC's in-house coders, the NPC has strict character limits for processing responses. Any responses longer than the allowed limits were manually truncated by NORC staff, highlighting what were believed to be either the main job of the respondent, or the most recent one, in the case of retired respondents.

However, this process was not without issue. While respondents in the face-to-face condition had interviewers who could assist them with identifying a specific single job, web-based respondents received no such support, and could share information on multiple jobs or industries, including, occasionally, full work histories. Furthermore, the GSS offers no guide beyond interviewer training to help respondents select from among multiple jobs. An experiment designed to address some of these issues was conducted in the 2022 GSS Next follow-on and is [discussed in the GSS 2022 Codebook](#).

Industry and Occupation variables are not available in the preliminary (R1) release of the 2024 GSS, but are expected in the complete (R2) release, expected in late summer 2025.

## Spouse vs. Co-habiting Partner

There are several GSS items that ask about the respondent's spouse or long-term partner. In the 2024 GSS, respondents are treated as married based on the combination of variables MARITAL, POSSLQ and POSSLQY. POSSLQ and POSSLQY identify respondents who are in long-term relationships which may be analogous to marriage but are not marriage. Respondents in these relationships receive the same questions as married respondents, but about their partners rather than spouses. For public release, NORC separates these two classes of respondents into the SP- (spouse) and CO- (cohabiting partner) variables, which are then mutually exclusive.

For example, if a respondent is married and living with their spouse, they will have a response coded into SPWRKSTA, and COWRKSTA will be coded as .i (inapplicable). If the respondent is not married but living with a partner, they will have a response for COWRKSTA and SPWRKSTA will be coded as .i (inapplicable). Likewise, if the respondent is single or in a relationship with a non-cohabiting partner, both SPWRKSTA and COWRKSTA will be .i (inapplicable).

## FAMILY16 and MA-/PA- Series

As respondents are increasingly more likely to be a part of a same-sex parent household, the 2024 GSS adjusted the FAMILY16 series of questions (i.e., question items FAMILY16A and FAMILY16B which are combined to make the publicly released variable FAMILY16 in GSS Cross-sections before 2024) to better reflect this possibility. Prior to 2024, the question FAMILY16A asked, “Were you living with both your own mother and father around the time you were 16?”. In 2024, this question was updated to ask, “Were you living with your own **two parents** around the time you were 16?” (emphasis added). If the respondent indicated they did live with both parents, they were asked a new follow-up question (question item FAMILY16C) asking the respondent to specify whether this was their “Mother and father”, “Two mothers”, or “Two fathers.” This response is captured in the variable FAMILY16SEX. We preserved the structure of FAMILY16 but updated the labels to use less gendered terms. Thus same-sex parent households are still reflected in FAMILY16 = 1, but with a new label “Both own **parents**” (emphasis added). In addition, we removed gendered terms for stepparents replacing FAMILY16 = 2 with “Father and **stepparent**” (emphasis added) and FAMILY16 = 3 with “Mother and **stepparent**” (emphasis added).

With this change, the follow-up questions regarding both parents needed to be adjusted. For those cases where a respondent had two mothers or two fathers, we specified the subject of PA- variables as the oldest mother or oldest father in two mother or two father households, respectively. Similarly, MA- variables asked about the youngest mother or youngest father in same-sex households. Labels for these variables were also updated to reflect this change (e.g., MADEG has the label “mother’s (or **youngest same-sex parent’s**) highest degree”, emphasis added).

## Paradata

### *Pre-interview*

Pre-interview variables include observations about the household conducted by the field interviewer prior to first contact with the household. These include observations about the physical address, characteristics of the household, and estimated likelihood of completing the interview. Because pre-interview paradata requires interviewer observations, it is only available for cases in MODESEQUENCE=1 (Face-to-face first condition). Pre-interview variables are not available in the preliminary (R1) release of the 2024 GSS, but are expected in the complete (R2) release, expected in late summer 2025.

### *Mid-interview*

Mid-interview variables include observations of mode and timestamps associated with specific sections of variables. In addition, the paradata also includes device type, browser, and operating system for all web-mode cases. These variables are not cleaned, and as a result, are not made directly available in the GSS 1972-2024 Cumulative datafile. Instead, they are available in a supplementary datafile at [gss.norc.org](https://gss.norc.umd.edu/). Mid-interview variables are not available in conjunction with the preliminary (R1) release of the 2024 GSS, but are expected in conjunction with the complete (R2) release, expected in late summer 2025.

### *Post-interview*

Post-interview paradata includes observations about the appearance and attitude of the respondent during the interview, whether or not others were present for the interview, and information about the appearance of the respondent's home. Post-interview paradata is tied to interviewer observation and occurs if an interviewer was present to complete a case. As a result, post-interview paradata may be available for cases with any value for MODE, including cases tagged as web-mode only. Post-interview variables are not available in the preliminary (R1) release of the 2024 GSS, but are expected in the complete (R2) release, expected in late summer 2025.

### *Other Sources of Paradata*

Other paradata are already available in the 2024 GSS Cross-section, including mode sequence experiment assignment and mode of survey administration. Select paradata tied to interviewer characteristics including interviewer race and ethnicity and incentives are expected in conjunction with the complete (R2) release, expected in late summer 2025.

## Disclosure Review and Limitation

NORC has enhanced privacy protections in the GSS and developed a plan for the 2024 data release to reduce identification risks, especially in demographic variables. This plan does not affect past data and focuses on safer data sharing in the future. The GSS has always been committed to ensuring the confidentiality of respondents and has engaged in various forms of disclosure review over its 50-year history. Recent advances in computing combined with more publicly available information on many Americans has led to increasing risks for GSS respondent re-identification, the GSS team has chosen to make a variety of changes to the 2024 GSS, limiting or restricting more disclosive variables, beginning with the 2024 data release. The GSS is modifying how we release standard demographic variables, focusing on collapsing smaller categories in order to preempt standard recodes which are frequently necessary for multivariate analysis. This shift in policy brings with it several consequences, all of which are outlined below. These policies will also have an impact on topic-sensitive variables yet to be released.

### *Summary of major changes*

---

Demographic recodes prompt the following changes:

**Default Variable Names:** Going forward, the GSS will reserve the cleanest, historical variable name for the active trend. Documentation will highlight when variables are shifting in this fashion.

**Historical Variable Preservation:** When a multi-year variable is no longer being maintained, it will now be amended with \_XXYY, which will designate the years where the trend was active (e.g., \_0022 designates the trend was active from 2000 through 2022).

**Restricted Data:** Some variables will be moved to restricted data if they cannot be safely preserved in the public datafile. These variables will be made available upon request via the sensitive data process.

---

## Default Variable Names

Beginning with R1 of the 2024 GSS, we will be preserving standard demographic variable names (e.g. HISPANIC, RACECEN1-3, SIBS) for the most up-to-date version of the variable. The variables affected by this change will see a recode in 2024, removing low sample size categories or categories generated as a result from open-ended responses in deference to originally offered response categories or coarsened response ranges. We are applying these recodes retroactively, so as to create an analytically useful trend up to the current survey year. Old contents of the variables will be preserved, where possible, under new names (see next section).

As of R1 of the 2024 GSS data, this policy affects the following variables: EARNRS, HISPANIC, NUMEMPS, RACECEN1, RACECEN2, RACECEN3, SIBS, USCITZN.

### *An example: HISPANIC*

In 2024, HISPANIC is being released as a five-category variable, considerably fewer than the 50 potential categories used historically across the GSS. While these 50 categories are useful for identifying individuals from specific Latin American countries, they generally do not produce enough respondents in any particular cross-section of the GSS to be analytically useful. Instead, we include the response categories as they were offered in the actual question wording. The contents of from the response category “Another Hispanic, Latino, or Spanish origin” are available upon request, like other GSS open-ends. For the GSS, the trend is equally important to the single-year measure, so we have chosen to release a 5-category HISPANIC variable for all available years, 2000-2024.

## Historical Variable Preservation

As we move to recode standard demographic variables, we will preserve old information within the GSS datafile as best as we can. Any variable with values altered by the new Default Variable Name policy will be given a new name reflecting the years in which it was the active variable for a given characteristic. These names will follow a standard suffix format of \_XYYY, where XX represents the last two digits of the first year that the variable was active, and YY represents the last two digits of the last year that the variable was active. We do not expect these newly renamed variables to return to the GSS in the future; they will act as an accessible archive for the sake of reproducibility and transparency.

Similar to the list above, the following variables are available in R1: EARNRS\_7222, HISPANIC\_0022, NUMEMPS\_0422, RACECEN1\_0022, RACECEN2\_0022, RACECEN3\_0022, SIBS\_7222, USCITZN\_0822, USCITZNV\_2122, USCITZNNV\_2122.

### *An example: SIBS*

From 1972 to 2022, SIBS was released as an unbounded variable, enumerating between 0 and 68 total siblings. The recode in 2024 eliminates this unbounding, now topcoding at 6+ siblings. As previous research may have used the unbounded SIBS, we want to preserve the data in the public datafile. As a result, the unbounded SIBS covering 1972-2022 is renamed into SIBS\_7222, while the new SIBS, capped at 6+ siblings, covers 1972-2024.

## Restricted Data

In conjunction with our disclosure policies, not every variable will be maintained in the public datafile moving forward. This is due to advances in statistical disclosure analysis leading to higher-than-tolerable risks for respondent identification for certain variables. While the GSS is committed to maintaining all reasonable variable trends and supporting dissemination of certain, some variables have been deemed unsafe for the public datafile. In particular, the GSS will no longer release mostly-redundant-but-overlapping variables in a variety of

demographic and paradata characteristics. While these versions of the variables will no longer be updated, we will maintain our capacity to create these variables. Any removed or historical variable which can be generated from existing demographic information will be made available as part of the restricted GSS data.

A detailed summary of these changes is available in [Appendix E](#).

# 2024 GSS CROSS-SECTION-SPECIFIC LAYOUT AND EXPERIMENTS

## GSS Layout & Questionnaires

While the GSS is fielded as a single survey, it is composed of three separate ballots. This rotating structure is discussed in greater detail in [GSS Methodological Report 52](#) and current distribution of questions is available in the [GSS 2024 Release Variables document](#). The questions that are repeated in each round are known as the *replicating core*. Other sections (which may reoccur, but not every year) are called *topical modules*. Figure 3 shows the distribution of topical modules in the 2024 GSS Cross-section.

Figure 3: Questionnaire Layout for the 2024 GSS Cross-section

|                                        | X    | Y  | XY |
|----------------------------------------|------|----|----|
|                                        | 2024 |    |    |
| MODULE                                 | A    | B  | C  |
| GSS Replicating Core                   | XY   | XY | XY |
| Household Enumeration Form             | X    | X  | X  |
| Household Enumeration Experimental     | Y    | Y  | Y  |
| American National Election Studies     | XY   | XY | XY |
| ISSP Digital Society                   | XY   | X  |    |
| ISSP National Identity and Citizenship |      | Y  | XY |
| Adult Mental Health Stigma             | X    | XY |    |
| Child Mental Health Stigma             | Y    |    | XY |
| CDC High-Risk Behaviors                |      | XY | XY |
| Contact/Validation                     | XY   | XY | XY |

The GSS includes slightly different wordings between web self-administered and phone interviewer-administered modes. See [Major Changes to the Cross-Section GSS in 2024](#) for full details. All questionnaires are available in both English and Spanish. For the 2024 GSS Cross-section, this amounts to 12 different questionnaires: three ballots in two modes in two languages.

The questionnaires can be found at <https://gss.norc.org/Get-Documentation/questionnaires>.

## Experiments in the 2024 GSS Cross-section

### Mode Assignment and Non-response Follow-up Experiment

Following the transition to web data collection in the 2021 GSS in response to the disruption of face-to-face collection due to the COVID-19 pandemic, the 2022 GSS allowed us the opportunity to experimentally test the use of both web and face-to-face data collection as part of a multimode design. The 2024 GSS allowed us the opportunity to replicate the test. Multimode designs are often used to yield cost savings while providing respondents with a mode that best meets their needs and helping achieve a high response rate.

For GSS sample cases, drawn from NORC’s National Frame, were randomly assigned to one of two multimode sequences (conditions 1 and 2) (see Figure 4). Condition 1 used face-to-face as the primary mode, encouraging respondent participation through mailing materials, telephone calls, and face-to-face visits. For non-respondents, this condition included a push-to-web effort asking respondents to complete the survey on the web. This condition most similarly resembles the historical face-to-face design of GSS from before the pandemic with the added inclusion of web follow-up. Condition 2 used a mail push-to-web methodology as the main mode of collection. This means that materials were mailed to sampled households inviting them to provide responses through a web instrument. Participation was encouraged through telephone calls and mailing materials. Following these initial outreach efforts, field interviewers visited the sampled address of the non-respondents to encourage them to participate in the survey. This condition most similarly resembles the 2021 GSS design with the addition of face-to-face follow-up for nonrespondents, like earlier years of the GSS. Both conditions were administered concurrently allowing us to scientifically compare the two conditions.

Additional details regarding the results of the experiment are available in [GSS Methodological Report 140](#).

Figure 4: Mode Assignment and Non-response Follow-up Experiment Design

## Question-level Wording and Presentation Experiments

### Volunteered Responses

For several questions in the GSS Replicating Core, the GSS has traditionally included options that are available for interviewers to code when volunteered by respondents but are not shown or read aloud to respondents. For example, in the traditional face to face instrument, the item COURTS (“In general, do you think the courts in this area deal too harshly or not harshly enough with criminals?”) includes “About right” as a *volunteered response* for the interviewer to code, but the option is not read to the respondent. These *volunteered responses* cannot be translated to the web mode effectively. In the web mode, respondents can only select responses that are shown to them on the screen, rather than being able to pick additional, unshown responses.

Motivated by this inability to translate the question design across mode, the 2024 GSS Cross-section includes an experiment examining volunteered responses that was first adopted in the 2021 GSS Cross-section and repeated

in the 2022 GSS Cross-section. **Seventeen questions** with volunteered responses were split into two new questions: **one with a -V suffix and the other with a -NV suffix**. The -V question, which appeared on FORM Y, included the volunteered response as an answer on the screen. The -NV question, which appeared on FORM X, did not include the volunteered response on the screen. A full list of variables for this experiment is shown in Table 3.

**These changes affect only the web mode.** In face-to-face interviews and the phone mode, respondents had the ability to volunteer responses just as they did in previous years, regardless of whether they received the -V or -NV form of the questionnaire. -V and -NV variables are tied to the mode that the item was administered in, which may be different from the mode assigned in MODE, which reflects the mode for the majority of the survey. As a result, some respondents will have MODE=1 and responses to -V or -NV variables.

Additionally, the -V and -NV variables only appear in the web mode, while the unmodified variable only appears in the face-to-face and phone modes. Users should be cautious about analyzing these variables, as the current GSS weights are not designed to work with mode-specific subsets of the data. Given the general increase in volunteered responses in the -V mode, trends using variables which merge the -V, -NV, and unmodified variable will look anomalous against the pre-2022 trends. NORC is currently working on developing mode-specific weights to allow respondents to better analyze this experiment.

The original version of the -V and -NV variables appear in the 2024 GSS Cross-section data along with the -V and -NV variables. For example, GRASS, GRASSV, and GRASSNV are asked in the 2024 GSS Cross-section. We do not recommend analyzing these variables with the standard GSS weights, as they are not designed to accommodate mode-specific subsamples of the data. We urge caution to users when trying to merge the -V and -NV variables with the non-experimental version, as the -V variables generally show a substantial increase in volunteered responses.

Inspection of unweighted data during production of the GSS dataset indicates that in nearly every case, variables tested (with the U.S. citizenship question being the only exception), the experimental condition showed some degree of shift toward the volunteered response option. The changes seem to be in double digits for most of the variables. These results suggest that visual representation of “volunteered” response options may have implications for the survey web design.

Additional details regarding the results of the 2022 version of the experiment are available in [GSS Methodological Report 141](#).

### Use of Grids

The 2024 GSS Cross-section includes an experiment on gridded questions in the web mode. This experiment was first introduced in the 2021 GSS Cross-section as motivated by the possibilities of the web mode, as well as by our attempts to reduce overall question length, and it was repeated in the 2022 GSS. We selected two sets of items that shared question stems, response options, and conceptual topics—the GSS Core items related to abortion and the GSS Core items related to suicide—and presented them in grids. See Figure 5 for an example of how grids were displayed in the web mode. The grids include no more than four items at a time. **For this experiment, the gridded version of each question appeared on FORM X, and the normal version of the question appeared on FORM Y. The gridded variables have the suffix -G.** A full list of variables for this experiment, as well as which grids they were placed in, is shown in Table 3.

Similar to the volunteered response experiment, phone cases were grouped with web cases by FORM. Phone respondents in FORM X had their responses recorded in the -G version of the variable despite being asked the questions verbally and not in grid format.

In the 2024 GSS Cross-section, all the -G variables have a corresponding non-experimental version, which has been asked on the GSS previously. For example, ABDEFECTG is the grid experiment version of the standard GSS variable ABDEFECT. Consequently, ABDEFECT is only available for half of sample (i.e., FORM Y) – compared to previous years – and ABDEFECTG is available for the other half (i.e., FORM X).

Inspection of data during analysis suggests that grids may have effects selectively on certain questions. Users should pay careful attention to the correlation between the gridded items, as showing multiple items per screen may increase inter-item correlation. In the seven abortion items, one did not appear in a grid (ABANYG), but our initial analysis indicated that it showed the effects of the grid experiment as well and has thus been given the -G suffix.

Additional details regarding the results of the 2022 version of experiment are available in [GSS Methodological Report 141](#).

The General Social Survey  

## Gender-neutral Wording

The 2024 GSS includes a version using gender-neutral wording, which is identified with a -Y suffix (the suffix that is standard to indicate wording experiments). For example, an item using gender-neutral wording displays “police officer” instead of a gendered “policeman.” For this experiment, FORM X contains the gendered item (typically using the word “man” and the pronouns “he,” “him,” and “his”), while FORM Y contains the gender-neutral wording. A list of new variables for this experiment is shown in Table 3. This experiment was first introduced in the 2021 GSS Cross-section.

Additionally, initial inspection of the data suggests that while effects may not affect all items, it may more selectively impact certain items. One variable, RACOPEN, was included in both experiments (i.e., gender neutral and volunteered response) and has been included as RACOPENV and RACOPENNV, rather than RACOPENY, as the -V and -NV effect appears stronger.

Additional details regarding the results of the experiment are available in [GSS Methodological Report 139](#).

In the 2024 GSS Cross-section, all the -Y variables in the gender-neutral wording experiment have a corresponding non-experimental version, which has been asked on the GSS previously. This effectively means that the original name is representing only one half of the sample (i.e., FORM X). For example, SPKATH is only available for half of sample (i.e., FORM X) – compared to previous years – and SPKATHY is available for the other half (i.e., FORM Y).

### *Vocabulary Experiment*

The 2024 GSS Cross-section includes an experimental version of the WORDSUM items, a series of 10 vocabulary items. This experiment is continued from the 2022 GSS. The original version of this series includes 5 easy words and 5 difficult words, while the new one removes 3 words and replaces them with medium difficulty words. These words have been used on the GSS in the past, in various panel-only experiments from 2008-2014. **The experimental version of the WORDSUM items appears on FORM X, while the original version appears on FORM Y.** The sequence of words for each FORM appears in Table 3 below.

### *Other Wording Experiments*

The 2024 GSS maintains several other long-running wording experiments, as well as adding new ones. These wording experiments are designated by the -X and -Y suffixes. Recent wording experiments continued in 2024 include XMOVIEY and the RACDIFX sequence. XMOVIEY updates the term “X-rated movie” to “Pornography” and includes the internet in possible sources of pornography. The RACDIFX sequence (RACDIF1X, RACDIF2X, RACDIF3X, RACDIF4X) uses a new extended intro which informs respondents that the questions have been asked for almost 50 years, and they are being asked again for historical comparison. However, a new RACDIF item, RACDIF5, was added in 2024 and we accounted for the above experiment in the variable RACDIF5X.

The 2024 GSS introduced two new wording experiments. The first experiment is CONLABORY which replaced the term “Organized labor” (CONLABOR) with “Labor unions.” The second experiment is MARSAMEY which replaced the term “homosexual couple” (MARSAME) with “same-sex couple.”

Existing wording experiments include the long-running wording variants in the national spending priority sequence (NATAID/NATAIDY, NATARMS/NATARMSY, NATCITY/NATCITYY, NATCRIME/NATCRIMY, NATDRUG/NATDRUGY, NATEDUC/NATEDUCY, NATENVIR/NATENVY, NATFARE/NATFAREY, NATHEAL/NATHEALY, NATRACE/NATRACEY, NATSPAC/NATSPACY) and the experiment using the term ‘living as married’ in POSSLQ/POSSLQY.

### *Summary*

The 2024 GSS Cross-section contains four kinds of standard experiment, all indicated by different types of suffixes affixed to the affected variables. Traditional wording experiments (where each version contains different wording in the introduction or question stem) end in either -X or -Y, dependent on form assignment. Gender-neutral wording experiments (a subset of traditional wording experiments) end in -Y. Grid experiments, where multiple items are presented on the same screen, are identified with the -G suffix. Finally, the volunteered/not volunteered experiment adds a response category to the variable with the -V suffix, and removes the same category entirely from variables with the -NV suffix. In the case of volunteered/not-volunteered and grids, these experiments are only present in the web mode, identified through the variable MODE. All experiments also use the variable FORM to assign the experimental conditions.

### Other experiments in the 2024 GSS

#### Household Composition

The 2024 GSS replicates the experimental version of the household composition module originally conducted in 2022, designed to shorten the time of administration for household enumeration, by collecting less detail on individual household members, while still gathering rich information on relationships in the household. These questions were asked on Form Y on all ballots. They are denoted with the suffix "\_exp" where applicable. Additionally, a series of new questions about specific household relationships were asked, which detail the kinds of relationships that the respondent has with various household members, but not relationships between other members of the household. For a comparison of the experimental and traditional forms of household composition, as well as the Household Enumeration form, please see [Table 2](#).

### Perception of Femininity and Masculinity

The 2024 GSS High-Risk Behaviors module variables FEMSELF1, MASCSSELF1, FEMSEE1, and MASCSSEE1, proposed by Aliya Saperstein at Stanford University, are part of a BALLOT/FORM experiment. This question series on Ballot 2 was asked at the beginning of the module, while the ones that appear on Ballot 3 were asked at the end of the module. Respondents with form X were presented with the "feminine" wording first (e.g., *On a scale from 0 to 6, with 0 meaning "Not at All" and 6 meaning "Very", how feminine do you see yourself? And how masculine do you see yourself?*) while respondents with form Y were presented with the "masculine" wording first, (e.g., *On a scale from 0 to 6, with 0 meaning "Not at All" and 6 meaning "Very", how masculine do you see yourself? And how feminine do you see yourself?*). All questions in this series were offered a gentle "nudge" to answer if the respondent tried to skip the question.

*Table 4: FEM/MASCSSELF1, FEM/MASCSSEE1 Variable Experiment*

| Ballot | Form | Notes                                                                                 |
|--------|------|---------------------------------------------------------------------------------------|
| 2      | X    | Asked at the beginning of the module; "feminine" wording presented before "masculine" |
| 2      | Y    | Asked at the beginning of the module; "masculine" wording presented before "feminine" |
| 3      | X    | Asked at the end of the module; "feminine" wording presented before "masculine"       |
| 3      | Y    | Asked at the end of the module; "masculine" wording presented before "feminine"       |

### Future Releases

The [2024 GSS Cross-section R1 Release Variables document](#) details which variables from the 2024 GSS Cross-section are available in the cumulative cross-section datafile as of Release 1. Subsequent releases will update that document as new variables become available. The following topics are not included in Release 1 but are expected in future releases:

- Industry, occupation, occupational prestige
- Religious preference
- Racial attitudes
- Household composition (traditional and experimental)
- Interviewer characteristic data
- Paradata
- Corrections to errors found in the GSS data

**GSS data releases now contain a version control variable: FILEVERSION.** Version 1 of the 2024 GSS Cross-section data was released in May 2025, with FILEVERSION set to 7224.1 for all cases.

## FIELDING

The 2024 GSS Cross-section was conducted from April 3, 2024 to December 2, 2024 and was processed according to standard NORC procedures.

Figure 6: Number of Interviews Completed per Month in 2024

For 2024, the GSS replicated the multimode design tested in 2022. Cases were randomized to one of two groups in 2024: the traditional in person-first group, in which trained interviewers attempted in person household contacting first or the second web-first group, in which households were first invited to participate via an online self-administered survey. Both groups then received non-response follow-up and were encouraged to complete the interview in any available mode – in person, by phone, or via the self-administered web survey.

For the **web-first condition**, initial outreach was conducted via mail. GSS staff continued to improve on redesigned mail-based outreach to respondents to introduce the GSS to fresh address-based sample and encourage them to participate by web. Throughout this initial phase of data collection, households in this experimental group were sent postcards, invitation packets, and reminder letters using a combination of USPS and FedEx and urging them to complete the 2024 GSS survey. After nine weeks, non-responders were subsampled and the remaining sample of households were contacted by trained interviewing staff to encourage interview completion in person or by telephone.

For our **in-person first condition**, this sample was treated more similarly to a “traditional” GSS household sample. Each randomly selected household in this group was mailed a notification postcard, followed by an invitation package, timed to be received shortly before they were likely to receive initial contact from a trained field interviewer. Initially, these households were only offered an in-person interview option, but after nine weeks, households also received mail invitations encouraging them to complete the interview via a self-administered web-survey.

In this non-response follow-up or NRFU period, both experimental groups received continued contact by trained field interviewers, encouraging participation across all three modes.

**Within households, respondents for the 2024 GSS were selected via a modified KISH method.** As a part of the GSS survey process, households either completed the household screener online as a self-administered screener or

with a trained field interviewer. A member of the household or “informant” completed a roster of all adults aged 18 and older living in the household. Based on the Kish grid for that household, one member of the household, the “respondent” was randomly selected to participate. For those screeners completed online, if the informant was selected as the respondent, the informant would be taken immediately to the web version of the GSS. If the informant differed from the selected respondent, the selected respondent received both email and mail invitations to complete the GSS interview separately. For those screeners completed in person, the interviewer provided information to the household to encourage completion of the GSS interview, either in-person or online. In all cases, once a household completed a screener and a member of the household was selected as a respondent, the project team would make a concerted effort to continue in-person, mail, and phone follow up with the respondent, encouraging survey completion.

From the start of fielding, respondents located in areas with high **Hispanic and/or Spanish-speaking** prevalence were mailed bilingual English/Spanish versions of materials. Determinations of the likelihood of a household having Spanish speakers were made with a combination of Census data and commercially available lists of likely Spanish-speaking households.

**Ultimately, 54.5% percent of respondents<sup>7</sup> completed the 2024 GSS survey via web survey, 34.7% percent of respondents completed it in person and 7.6% percent of respondents completed it by phone, with the remainder completing across multiple modes. The weighted 2024 Cross-section response rate was 44.65% percent.**

---

<sup>7</sup> All percentages weighted using WTSSPS.

## SAMPLING DESIGN AND WEIGHTS

### The 2024 GSS Cross-section Sample

The **GSS 2024 baseline sample** was divided into two experimental conditions. In one condition, addresses were first contacted by mail with an invitation to fill out a web GSS questionnaire (Web-First). After nine weeks, the addresses that did not fill out a web GSS questionnaire were subsampled for face-to-face in-person interviewing. The GSS targeted 1,600 completes for Web-First cases. In the second condition, addresses would first be visited in-person for interviewing (FTF-First) and would later in the field period be mailed invitations to fill out a web GSS questionnaire. The GSS targeted 1,600 completes for FTF-First cases.

The Web-First sample consisted of 9,869 addresses, and the FTF-First sample consisted of 4,031 addresses. All addresses were sampled from the NORC 2020 National Sampling Frame, which we describe below.

Table 5 shows sample release sizes, completed cases, and weighted response rates for each experimental condition. As the sample source, the NORC National Sampling Frame provides the basis for an equal-probability multi-stage cluster sample of housing units for the entire United States. Every decade, NORC reselects a National Sampling Frame based on the Decennial Census. The 2024 GSS was the first to use the 2020 NORC National Sampling Frame.

**First-stage units** on the National Sampling Frame are called National Frame Areas (NFAs), each of which is composed of a USPS Metropolitan Statistical Area (MSA) of one or more counties outside of MSAs. The number of first-stage selections in the 2020 NORC National Sampling Frame is 186 NFAs and the GSS sample uses only 74 NFAs.<sup>8</sup> Fifty-four of the GSS NFAs are non-certainty NFAs in the GSS that overall represent 53 percent of the U.S. population, and the remaining 20 of the GSS NFAs are certainty NFAs containing 47 percent of the U.S. population. The **second-stage** selection yielded a sample of segments that are census tracts in urban areas (where post office address lists are usually available) and a sample of segments that are block groups (smaller than census tracts) in rural areas where physical listing is often required.

The **first-stage units** (NFAs) and **second-stage units** (either census tracks or block groups) were selected with probabilities proportional to size, where the measure of size is determined by Census housing unit totals. The third-stage units (i.e., housing units) were selected with an equal probability of selection method (EPSEM)—which means that each housing unit has the same probability of selection. Using the EPSEM approach resulted in roughly the same number of housing units selected per second-stage sampling unit. The number of second-stage selections in the 2020 NORC National Frame is 3,096, and the GSS selected 400 second-stage selections.

Most of the addresses in the NORC National Sampling Frame come from the USPS CDS, but some came from in-office and in-person listing of areas where the CDS did not provide at least 90 percent coverage.

---

<sup>8</sup> Among the 186 NFAs, the GSS did not select from 3 NFAs in Arizona that were not listed for sample selection due to most of the population in these NFAs living in Native American tribal areas.

Table 5: Yields by Experimental Condition<sup>9</sup>

| Condition    | Sample Released | Completes    | Weighted Response Rate |
|--------------|-----------------|--------------|------------------------|
| Web-First    | 9,869           | 1,798        | 44.81%                 |
| FTF-First    | 4,031           | 1,511        | 44.24%                 |
| <i>Total</i> | <i>13,900</i>   | <i>3,309</i> | <i>44.65%</i>          |

## GSS Post-stratification Weights

The weight variables (WTSS and WTSSNR) historically provided in previous GSS data files made simple adjustments of the GSS sampling design (i.e., sub-sampling). For the 2024 GSS Cross-section (like the 2021 and 2022 GSS Cross-Sections), we do not provide those design-adjusted weights; we have instead added weights adjusted by population controls; that is, post-stratification weight variables WTSSPS and WTSSNRPS. Due to the subsampling involved, it is very important to use these post-stratification weights to get more representative results. This section details the methodology used to calculate the post-stratification weights for the 2024 GSS Cross-section Sample. As of Release 1, NORC is including post-stratified weights: WTSSPS and WTSSNRPS. WTSSPS is available for years 1972-2024 and WTSSNRPS is available for years 2004-2024.

**WTSSPS:** We assigned this weight to the completed cases; it accounts for all stages of selection: NFA, segment, housing unit, within household, and raking to known population totals.

**WTSSNRPS:** This weight had one additional step: a non-response adjustment.

Both weight variables are scaled so that they sum to the number of completed cases (3,309).

**WTSSPS and WTSSNRPS are the recommended weights of the GSS 1972-2024 Cumulative data file.** WTSSPS is the recommended weight for analysis conducted from 1972-2024 and is now the default weight for the [GSS Data Explorer](#). Both WTSSPS and WTSSNRPS are available for data users for 2004-2024. For years where WTSSNRPS is available, NORC recommends data users use WTSSNRPS.

In addition to adjusting to population controls, these weights:

- correct for form errors reported in [GSS Methodological Report 36](#) for 1978, 1980, 1982, 1983, 1984, and 1985;
  - correct for the ballot-and-form assignment errors reported in [GSS Methodological Report 134](#) for 2002, 2010, 2012, 2016, and 2018; and
  - support person-level analyses of the combined main and [Black oversamples for 1982 and 1987](#).
- This means that these corrections no longer need to be applied to the primary weights. The inclusion of these corrections makes these weights simpler and superior for all data users.

For more details regarding this recommendation, please refer to [GSS Methodological Report 137](#).

<sup>9</sup> Given the mode sequence experiment is only for the baseline cases, the weight variable WTSSNRPS was used. For more detail on response rate calculations, see [Appendix A](#).

## Post-stratification Weighting Methodology Steps in 2024

We calculated the weights for the 2024 GSS Cross-section cases using similar methods used in previous rounds (2021 was the exception since no interviews were collected in person)—however, with an additional raking step to adjust to known population totals.

**W0.** First, we account for the selection of the NFA, segment, and housing unit. These probabilities come out of NORC's FrameTool sampling software. GSS is an equal-probability sample. The 13,900 housing units released have a selection probability of 0.0000942539. The base weight for most cases is 10609.644308 (1 / selection probability).

**W1.** Second, we account for the subsampling of nonrespondents at the end of Phase 1 of data collection. Only the web-first cases were subjected to subsampling, and only if they were not completed before in-person interviewing (Phase 2) began. The weight of cases completed during Phase 1 are unchanged. The weight of cases selected for Phase 2 follow-up are increased by a factor equal to the inverse of their probability of selection for follow-up. Three separate subsampling rates were used by different groupings of NFAs and segments based on level of staffing, using subsampling rates of either 20.5 percent, 30.7 percent, or 40.9 percent. This weight adjustment divided W0 by the subsampling rate for the subsampling category to obtain W1.  $W1=W0$  for all FTF-first cases.

**W2.** Third, we adjust for eligibility. Not all cases in the frame are truly eligible for the survey: some are businesses, do not exist, or are unoccupied. This adjustment sets the weights of the ineligible cases to zero and sets  $W2=W1$  for eligible cases. The 372 cases whose eligibility could not be determined (disp=99 FINAL Other - Elig unknown) are given fractional eligibility (0.8533) based on the weighted estimates of eligible cases among cases with known eligibility status using weight W1.

**W3.** The next step, an optional non-response adjustment, is done for the WTSSNRPS process but skipped for the WTSSPS process. This step distributes the weight of the non-responding cases to the responding cases. GSS traditionally uses a geographical non-response weight adjustment, and we did that here using NFA. This step also creates the overall weighted response rate, which is 44.6 percent for the 2024 GSS baseline cases.

**W4.** We performed all the steps through W3 at the household level, but the final GSS weights are at the individual adult level. Therefore, this step adjusts for the probability of selecting the respondent within the household. This probability is the inverse of the number of adults in the household. We limit this adjustment to a maximum of five adults. The number of adults exceeded five for only three of the households with completed interviews. Sixteen respondents had no value for ADULTS, and so a hot-deck imputation described below was used to impute these missing cases.

**W5.** Finally, the GSS adjusts weights to known population totals from the U.S. Census Bureau. We selected eight variables for a raking algorithm, which iteratively adjusts the weights to sum to the known population totals for each category of each of the raking variables, one at a time until the raked weights converge.

Most of these variables have missing data. Missing responses were imputed using a simple hot-deck imputation prior to raking. For this simple hot-deck imputation, we only used variables previously imputed as sorting variables. Number of adults in the household was also used in the imputation procedure for its use to calculate W4. The variables used in the imputation procedure before raking were:

**Census Division** (never missing, nine categories):

- New England

- Mid-Atlantic
- East North Central
- West North Central
- South Atlantic
- East South Central
- West South Central
- Mountain
- Pacific

**Education** (0 imputed values, three categories):

- Less than High School Education
- High School Diploma, but no Four-Year College Degree
- Bachelor's Degree or more

**Marital Status** (15 imputed values, two categories):

- Currently Married
- Not Currently Married

**Number of Adults** (16 imputed values, five categories, used only for W4 and not for raking):

- 1 Adult
- 2 Adults
- 3 Adults
- 4 Adults
- 5 or More Adults

**U.S. Born Status** (18 imputed values, two categories):

- Born in the United States
- Not Born in the United States

**Sex** (19 imputed values, two categories):

- Male
- Female

**Hispanic Origin Status and Race**<sup>10</sup> (19 imputed values for Hispanic ethnicity and subsequently 31 non-Hispanic cases had race imputed, eight categories):

---

<sup>10</sup> Hispanic ethnicity and race were previously used as separate variables in GSS post-stratification procedures. However, race measurement changes from the U.S. Census Bureau described in <https://www.census.gov/newsroom/blogs/random->

- Hispanic
- Non-Hispanic, White Alone
- Non-Hispanic, Black Alone
- Non-Hispanic, American Indian/Alaska Native Alone
- Non-Hispanic, Asian Alone
- Non-Hispanic, Native Hawaiian or Other Pacific Islander Alone
- Non-Hispanic, Other Single Race Group Alone
- Non-Hispanic, Multiple Races

**Age Group** (101 imputed values, five categories):

- 18–29 years old
- 30–39 years old
- 40–49 years old
- 50–64 years old
- 65–89 years old

For raking, cells that had fewer than 20 respondents were collapsed with other categories.

**Final weights.** The weights that result from this process are then scaled to the number of completed cases (3,309) to result in WTSSPS and WTSSNRPS.

## Weights for the GSS Cumulative Cross-section

With the availability of WTSSPS and WTSSNRPS for all GSS years, historical weights are included in the data for historical record. The adjustments related to ballot or form errors, or racial oversamples are incorporated into WTSSPS and WTSSNRPS removing the need to make weight adjustments for these situations.

*Table 6: Historical GSS Weights and Weight Adjustments*

| Weight | Reason For Weighting                                                                                                                                                                                                                                                             | Sample Years |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| WTSSPS | Beginning in 2021, the GSS implemented post-stratification as a standard part of the GSS weighting procedure to better represent population controls. WTSSPS automatically incorporates the form issue (FORMWT), the 1982 and 1987 oversamples (OVERSAMP) and the correction for | 1972-2024    |

[samplings/2021/08/improvements-to-2020-census-race-hispanic-origin-question-designs.html](https://www.gss.norc.uchicago.edu/samplings/2021/08/improvements-to-2020-census-race-hispanic-origin-question-designs.html) resulted in large changes in race estimates after the 2020 U.S. Census. The GSS team found that using a raking dimension that crosses Hispanic ethnicity and race according to the categories shown here produces much more stable estimates comparing before and after the 2020 Census. Thus, the GSS post-stratification procedures now use a cross-classification of Hispanic ethnicity and race.

| Weight                          | Reason For Weighting                                                                                                                                                                                                                                                                                                                            | Sample Years                                            |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
|                                 | the ballot and form assignment issue (BALLOTFORMWT). This weight is a parallel weight to WTSSALL.                                                                                                                                                                                                                                               |                                                         |
| WTSSNRPS                        | WTSSNRPS is a post-stratification weight following the same pattern as WTSSPS, but also incorporates the NFA adjustment like its parallel weight, WTSSNR.                                                                                                                                                                                       | 2004-2024                                               |
| WTSSPS_AS,<br>WTSSNRPS_AS       | Equivalent to WTSSPS and WTSSNRPS, respectively, but also includes the 605 AmeriSpeak oversample cases for GSS 2022 and the 677 cases for GSS 2024. These weights are not available in the preliminary (R1) release of the 2024 GSS, but are expected in the complete (R2) release, expected in late summer 2025.                               | 2022-2024                                               |
| WTSSALL                         | WTSSALL expands the adults-in-household adjustment from WTSS to all years prior to 2004. No such adjustment is possible to account for sub-sampling of nonrespondents. However, from 2004 onwards, WTSS and WTSSALL are equal.                                                                                                                  | 1972-2018                                               |
| WTSSNR                          | Beginning in 2004, the GSS began to use a two-stage sub-sampling design for nonresponse. To obtain weighted estimates adjusted for this non-response, users should use the -NR weight in these years (either WTSSNR or WTSSNRPS depending on the year of interest)                                                                              | 2004-2018                                               |
| WTSS                            | Beginning in 2004, the GSS implemented a two-stage sub-sampling design for nonresponse. In these years, users should use WTSS to adjust for both sub-sampling of nonrespondents (via an area non-response adjustment) and number of adults in the household, although the GSS is self-correcting for the latter with household-level variables. | 2004-2018                                               |
| BALLOTFORMWT,<br>BALLOTFORMWTNR | BALLOTFORMWT has updated values for WTSSALL that can fix the ballot and form assignment issue. BALLOTFORMWTNR has updated values for WTSSNR. For more information about the ballot and form assignment issue, please see <a href="#">GSS Methodological Report 134</a> . Incorporated into WTSSPS and WTSSNRPS.                                 | 2002 (BALLOTFORMWT only),<br>2010, 2012, 2016, and 2018 |
| OVERSAMP                        | The 1982 and 1987 GSSs included oversamples of Black respondents. To adjust statistical results for                                                                                                                                                                                                                                             | 1982, 1987                                              |

| Weight | Reason For Weighting                                                                                                                                                                                                                                                                                                                                   | Sample Years          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
|        | this oversampling, users should exclude cases in the Black oversamples (codes 4, 5, and 7 on variable SAMPLE). Alternatively, if only analyzing the 1982 or 1987 samples users can weight statistical results using the OVERSAMP weight. Incorporated into WTSSPS and WTSSNRPS.                                                                        |                       |
| FORMWT | A certain set of variables in these samples are based on questions that only appeared on one form and as a result were only asked of a subset of participants. Therefore, users must use a FORMWT when analyzing variables that appear on this list: <a href="#">Appendix P of the 1972-2018 GSS Codebook</a> . Incorporated into WTSSPS and WTSSNRPS. | 1978, 1980, 1982-1985 |

## Precision of Estimates

The GSS uses a complex sample design incorporating stratification, clustering, subsampling, within-household selection of an adult, and other weighting adjustments. Because of this, the uncertainty of estimates for the GSS is larger than that of a simple random sample with the same number of respondents. In Table 7, we provide 95% margins of error for estimates from the 2024 GSS for different GSS weights. To be conservative, these calculations are for estimates of statistics of 50% for variables. The margin of error accounts for the additional uncertainty due to clustering for a variable at the median of GSS variables in its level of variation among sampling clusters. We also present the design effect due to unequal weighting alone<sup>11</sup> based upon the formula  $n \sum_{i=1}^n w_i^2 / (\sum_{i=1}^n w_i)^2$  where  $n$  is the number of respondents and  $w_i$  is the survey weight for respondent  $i$ .

*Table 7: Design Effect and Effective Sample Size for GSS 2024*

| Weight   | Sample Size | Design Effect Due to Unequal Weights | Margin of Error |
|----------|-------------|--------------------------------------|-----------------|
| WTSSPS   | 3,309       | 1.96                                 | 2.72%           |
| WTSSNRPS | 3,309       | 1.97                                 | 2.72%           |

## RESERVE CODES AND MISSING VALUES

The 2024 GSS Cross-section now uses a standardized set of missing values for all variables in Stata and SAS:

item).

**.i – Inapplicable (IAP).** This reserve code is used when a respondent does not see a question, either due to structural factors (e.g., for a respondent on ballot C, they will be marked inapplicable for a question exclusive to ballots A and B) or to personal factors (e.g., a respondent who is not married will be marked inapplicable for a spouse-related

**.n – No Answer (NA).** This reserve code is used when a respondent refuses to answer a question. If a respondent gives a “No Answer” response to a screener question, all follow-up questions are marked as “No Answer.”

**d – Don’t know (DK).** This reserve code is used when respondents indicate that they do not know the answer to a question. For some variables (mostly ISSP variables), this code is used for “Can’t choose” which was a response option offered to respondents unlike “Don’t know” which was not offered.

**.s – Skipped on Web.** This reserve code is used when a respondent skips a question in the web mode. If a respondent skips a screener question, follow-up questions are marked as “Skipped on Web.”

**.z – Variable-specific reserve code.** Several variables also include a .z reserve code, which documents circumstances or changes that might lead to odd missing data. For example, in 2021, some respondents in the Religion topical module have .z codes because their assigned religion was recoded based on open-ended responses, and as a result, their movement through the module was different than what their responses to RELIG and DENOM imply.

**.u – Uncodeable.** Some open-ended responses were not codeable to numeric codes, and .u was used instead in such cases.

**.p – Not imputable.** This missing code is used in variables POVLINE and INCDEF (GSS 1972-1993). For more information about these variables, please refer to [GSS Methodological Report 57](#) available on the GSS main website.

**.f – Birthdate not available.** This missing code is used in the variable VIETDRAFT. Please see the [2021 GSS codebook](#) on the GSS main website for more information.

**.r – Refused.** This missing code is used in income variables (e.g., INCOME, RINCOME, INCOME16, RINCOM16) and the RACEACS series.

**.x – Not available in this release.** Variables that were asked in the 2024 GSS Cross-section but that have proven difficult to clean have been omitted from the first data release. Instead of dropping the variable entirely, all cases are marked with .x, indicating that the data will be made available in a subsequent release.

**.y – Not available in this year.** Variables that are included in the cumulative GSS datafile but that were not asked in 2024 are coded .y for all cases in 2024. The same is true for variables that are

unavailable in 2022, 2021, 2018, 2016, etc. This process is ongoing for earlier years. The intended purpose of .y is to more easily identify if two variables that are not part of the replicating core have ever overlapped in a given year.

**.j – I don’t have a job.** This missing code is for variables from the People Known module (prefix ACQ-) from the 2006 GSS.

**.m – DK, NA, IAP.** Variables created in the 1970s (e.g., OCC, INDUSTRY) used a single missing value that had multiple meanings. .m can mean “Don’t know”, “No answer”, or “Inapplicable”.

An alternative set of missing values is used for SPSS and Data Explorer because these programs cannot use the user-defined missing values from SAS and Stata. Therefore, negative numbers are set as user-defined missing values corresponding to the list detailed above standardizing missing values across variables. A crosswalk of these user-defined missing values is in Table 8.

*Table 8: Missing Values by Program*

| SAS/Stata | SPSS/Data Explorer |
|-----------|--------------------|
| .i        | -100               |
| .n        | -99                |
| .d        | -98                |
| .s        | -97                |
| .z        | -96                |
| .u        | -95                |
| .p        | -94                |
| .f        | -93                |
| .r        | -90                |
| .x        | -80                |
| .y        | -70                |
| .j        | -60                |
| .m        | -40                |

## HOW TO READ GSS CODEBOOK TABLES

For ease of usability and communication, the 2021 General Social Survey denotes a break from the codebook format that the GSS has been historically using. While the traditional codebook is still available with data up to the 2018 GSS, this new codebook format will continue to be used for the foreseeable future. To facilitate the use of this new format, several terms must be explained. The abbreviation “R,” which appears throughout the text and appendices, stands for “respondent.” Figure 7 shows the format for the codebook tables.

Figure 7: Codebook table excerpt

| <b>Variable: HAPMAR    Type: Numeric</b>                                                                                                                                                                          |              |              |            |                                        |

To help with ease of explanation, the example of “HAPMAR” provided can be divided into two sections: 1) Variable information—which can be found at the top of the question information—and 2) Variable responses—which can be found at the middle and bottom of the question.

### Variable Information:

The title **Variable** (in the example, for HAPMAR) denotes the variable name. A mnemonic was assigned to each question to promote standardization in the use of GSS variable names and to meet the eight-character limitation imposed by some computer software systems (e.g., SPSS)

**Type** (in the example, “Numeric”) refers to the form in which responses were coded. Questions were either recorded as “numeric” or “character.” Numeric variables may have a limited number of preset responses (e.g., “Agree” or “Disagree,” “Yes” or “No”) to which numeric “punches” or values are assigned, or, in the case of HAPMAR, responses are open-ended but numeric in nature. Character variables are generally

open-ended questions with no preset responses (e.g., SEXSPEC).

**Label** shows question wording as it appeared in the questionnaire. For some variables, as is the case of HAPMAR, some question wording appears in full uppercase font. This uppercase information communicates conditions for the variable that interviewers were to be aware of as they conducted the questionnaire. This information was for the benefit of the interviewer, and respondents were not aware.

The **Notes** section is where essential question information appears (in the example, it is empty). This question information denotes historical changes to the variable, the manner in which the variable was asked, or as is the case in HAPMAR, related variables. For variables that have experienced historical changes, the “Notes” section directs readers to the appropriate reports to learn of those alterations over time.

### Variable Responses:

Under the heading **LABEL**, all possible answers to the questions are listed. The questionnaire contains four alternate forms of response as follows: 1) the answers were read to the respondent or listed on the screen in the

web-mode (if they were included in the question); 2) answers were presented to the respondent on a card (indicated by interviewer instructions and variable notes); or 3) answers were marked by the interviewer to best correspond to the answer of the respondent (also indicated by interviewer instructions and variable note).

The term **VALUE** represents the code or numerical value that was assigned to each response. These are the numbers that the user will find punched in the columns. The frequency of occurrence of each of the punch values appears in the next three columns: first as a simple count of occurrences (i.e., unweighted frequency), then as a marginal unweighted percent of the individual responses, and finally as a cumulative unweighted percent in the final column headed **PCT Excl. Reserve Codes**. Summations of these three columns can be found along the **SUBTOTALS** row.

Respondents that did not choose one of the response codes, either intentionally or because they were not applicable, are captured in the **RESERVE CODES** table. The manner or reason of respondent item non-response is denoted either as "Don't Know," "Skipped on Web," or "Not applicable." The counts and marginal unweighted percent of these reserve codes is delineated in the following columns as was done with the **VALUE** table. Responses are mutually exclusive (i.e., only one code can appear for each respondent for each question), and final totals of all responses are in the final row, which is titled **TOTALS**.

## APPENDIX A: 2024 GSS Cross-section Outcomes

The overall weighted response rate for the 2024 GSS Cross-section data collection was 44.65 percent, with 3,309 completes from 13,900 lines of sample (after subsampling) from two frames. The number of completes exceeded our original targets. Case status broke out as follows:

*Table A1: Unweighted 2024 GSS Cross-section Response Rate Information*

| Status                                             | 2024 GSS Cross-section |
|----------------------------------------------------|------------------------|
| Complete                                           | 3,309                  |
| Eligible cases (Partial or NIR)                    | 3,059                  |
| Non-interviewed respondent – Eligibility not known | 372                    |
| Known ineligible                                   | 1,004                  |
| Subsampled out                                     | 6,156                  |
| Total                                              | 13,900                 |

In 2024, the weighted response rate is 44.65 percent (AAPOR response rate 3). For this calculation, the GSS considers used an eligibility rate (e) of 0.8533 for unknown eligibility cases, based on the fraction of baseline sample cases with known eligibility. These weights were calculated based on subsampling stages, unknown eligibility of cases, and other sample adjustments.

## APPENDIX B: 2024 GSS Analysis of Sex by Ballot and Form Combinations

The GSS team monitors whether demographic variables including sex are balanced across ballot and form combinations. In the sampling process, the GSS team carefully implements independent random assignments of design variables including ballot, form, and Kish number. Kish number is used to assign which adult in a sampled household is selected to complete the survey interview. It includes six digits, with the  $n$ th digit used to determine for a household with  $n$  adults which adult in the household is selected for the GSS interview. Kish digits can be related to sex based on the order in which adults are rostered in a sampled household. However, if variables like ballot, form, and Kish number are assigned randomly and independently, the demographic characteristics of respondents across ballot and form combinations are expected to be similar on average.

In the past, errors in random assignment by ballot and form combinations were identified for specific GSS rounds, with the findings described in [GSS Methodological Report 134](#). The GSS has now updated random assignment processes to prevent such errors.

Even with the care in random assignment processes, it is still possible for there to be differences in the sex balance by ballot and form combinations due to randomness in the response patterns. Here, we describe findings for the 2024 data so that data users are aware of some imbalances for sex by ballot and form combinations when conducting analyses.

Table B1 presents the estimates of the percentage of respondents who are female by the six ballot and form combinations, weighted by the final weight that is not adjusted for nonresponse, WTSSPS. Results are similar when using WTSSNRPS incorporating the nonresponse adjustment. Because the selection of the adult in the household is based on different Kish digits in households with different numbers of adults, we also present the percentage of respondents who are female by ballot and form combinations for households with different numbers of adults.

*Table B1: Percentage of 2024 GSS Respondents Who Are Female by Ballot and Form Combinations and Number of Adults in Households, Weighted by WTSSPS*

|                     | Percentage of Respondents Who Are Female<br>(Standard Error) |               |               |               |                |
|---------------------|--------------------------------------------------------------|---------------|---------------|---------------|----------------|
| Ballot and Form     | Overall                                                      | 1 Adult       | 2 Adults      | 3 Adults      | 4+ Adults      |
| AX                  | 50.5<br>(3.1)                                                | 48.7<br>(5.0) | 51.2<br>(4.3) | 50.5<br>(7.1) | 52.2<br>(10.3) |
| AY                  | 57.8<br>(2.8)                                                | 59.2<br>(4.8) | 51.7<br>(4.0) | 67.9<br>(6.7) | 61.3<br>(7.3)  |
| BX                  | 54.5<br>(2.7)                                                | 60.1<br>(4.1) | 51.1<br>(3.4) | 56.5<br>(9.1) | 57.5<br>(10.7) |
| BY                  | 44.3<br>(3.2)                                                | 54.6<br>(4.1) | 43.4<br>(3.9) | 49.5<br>(7.3) | 23.8<br>(3.4)  |
| CX                  | 45.5<br>(3.1)                                                | 53.3<br>(4.3) | 48.3<br>(3.9) | 36.2<br>(7.0) | 37.6<br>(8.0)  |
| CY                  | 53.7<br>(3.0)                                                | 58.8<br>(3.0) | 52.4<br>(3.7) | 44.8<br>(7.9) | 70.0<br>(7.6)  |
| Number of responses | 3,309                                                        | 1,351         | 1,451         | 355           | 152            |
| Chi-square p-value  | 0.0099                                                       | 0.3383        | 0.6046        | 0.0739        | 0.0002         |

The results show that there are statistically significant differences in the percentage of respondents who are female across combinations of ballot and form ( $p$ -value 0.0099 using chi-square test of independence accounting for the survey design). The percentage of respondents who are female ranges between 44.3% for ballot/form combination BY and 57.8% for ballot/form combination AY. Note that this finding is only statistically significant when examining the association of sex with the combination of ballot and form but not for the associations with ballot alone ( $p$ -value 0.1813) nor form alone ( $p$ -value 0.4436).

Within households with either 1 or 2 adults, the differences in the percentage female by ballot and form combinations is not statistically significant ( $p$ -values of 0.3407 and 0.6051, respectively) and thus reasonable by random chance. More substantial variation is found for 3 and 4 or more adult households. The association between sex and ballot/form combinations is marginally significant for respondents in 3 adult households (355 respondents,  $p$ -value 0.0775) and highly significant for respondents in households with 4 or more adults (152 respondents,  $p$ -value 0.0003). Thus, the overall differences in the sex balance by ballot and form is largely due to the patterns in the 3 and 4 or more adult households.<sup>12</sup>

Further analyses confirm that these results are not driven by the sample design nor the random assignment of variables like Kish number, ballot, and form, which is expected based on the care with the sample design. Table B2 reviews the chi-square  $p$ -values for the association between different Kish digits and ballot-and-form assignments.<sup>13</sup> With the findings in the above table for the 3 and 4 or more adult households, we particularly reviewed the results for the 3<sup>rd</sup> through 6<sup>th</sup> Kish digits. All of the  $p$ -values demonstrate lack of a statistically significant relationship based on the sample design.

*Table B2: Chi-Square  $p$ -Values for Tests of Independence Between Kish Digits and Ballot and Form Combinations Among 13,900 Sampled Cases for 2024 GSS*

| Kish Digit      | Chi-square $p$ -value |
|-----------------|-----------------------|
| 2 <sup>nd</sup> | 0.3336                |
| 3 <sup>rd</sup> | 0.3707                |
| 4 <sup>th</sup> | 0.1574                |
| 5 <sup>th</sup> | 0.8839                |
| 6 <sup>th</sup> | 0.2427                |

The NORC team reviewed additional analyses regarding sample design variables and did not find anything in the sample design process that would explain the relationship found between sex and ballot-and-form combinations for the 3 and 4 or more adult households, including examining of such variables as assignment of first mode and selection for subsampling.

GSS data users should be aware of the differences in the sex balance when analyzing data from specific ballot-and-form combinations. Also note this finding this should not be a concern for GSS data users analyzing data from a specific ballot or form, as no statistically significant association was found between sex and either ballot or form alone.

<sup>12</sup> The same analysis was conducted for the 2022 GSS. Overall, no statistically significant differences between sex and ballot-and-form combinations were found in 2022 ( $p$ -value 0.3784). Of the four groups of respondents in households with different numbers of adults, the relationship between sex and ballot-and-form combinations was statistically significant only among the 148 respondents in households with four or more adults ( $p$ -value 0.0003).

<sup>13</sup> The statistical test results in Table B2 do not reflect incorporation of stratification and clustering in the testing, as Kish digit, ballot, and form assignments are not clustered according to GSS geographies.

## APPENDIX C: Sample Code for Analysis

### Data Use

#### SAS only

```
libname gss 'C:\GSS_sas'; /* Replace 'C:\GSS_sas' with an appropriate folder location */
data newdata; /* "newdata" is a filename of the modified data */
set gss.gss7224_r1;
keep id year wtssps wtssnrps vpsu vstrat wrkstat; /* variable list */
run;
```

If you experience errors in SAS locating the format library associated with the GSS data set, you can use the following code to help locate the format library for use during your session.

```
option fmtsearch=(gss) nofmterr;
```

#### STATA only

By default, Stata/MP and Stata/SE can only handle 5,000 variables, while the cumulative GSS data set has nearly 7,000 variables. Thus, users should increase the maximum number to something like 7,000 to run the cumulative GSS data.

```
set maxvar 7000, permanent
```

(Please note Stata/IC cannot handle all variables in the cumulative GSS data file.)

#### SPSS only

To account for the complex sample design in SPSS, you will need to use the Complex Samples software. This requires a "plan file" (.csaplan file type) which can be generated under the "Prepare for Analysis" option under Analyze > Complex Samples. In the Analysis Preparation Wizard, you want to specify Strata as VSTRAT, Clusters as VPSU, and Sample Weight as either WTSSPS or WTSSNRPS. Finally, specify Estimation Method as "WR (sampling with replacement)". An example of the .csaplan file contents is below:

```
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<SPSSComplexSamples version="1.0">
  <AnalysisDesign SRSEstimator="wor" numberOfStages="1">
    <AnalysisStage estimationMethod="wr" stageNumber="1">
      <StrataVarList numberOfVariables="1">
        <Variable name="vstrat"/>
      </StrataVarList>
      <ClusterVarList numberOfVariables="1">
        <Variable name="vpsu"/>
      </ClusterVarList>
    </AnalysisStage>
    <Weight>
      <Variable name="wtssnrps"/>
    </Weight>
  </AnalysisDesign>
</SPSSComplexSamples>
```

## Data Analysis (example)

### SAS

```
proc surveyfreq data=gss.gss7224_r1 nosummary;  
    cluster VPSU;  
    strata VSTRAT;  
    weight WTSSNRPS;  
    table WRKSTAT;  
run;
```

### STATA

```
svyset [pweight=wtssnrps], strata(vstrat) psu(vpsu) singleunit(scaled)  
svy: tab wrkstat, percent se format(%4.1f)
```

### SPSS

When conducting complex survey analyses, you will be asked to specify the .csaplan file described above.

```
CSTABULATE  
  /PLAN FILE='C:\gss complex sample plan.csaplan'  
  /TABLES VARIABLES=wrkstat  
  /CELLS TABLEPCT  
  /STATISTICS SE  
  /MISSING SCOPE=TABLE CLASSMISSING=EXCLUDE.
```

## APPENDIX D: Other GSS Datasets and Documentation

### 2016-2020 GSS Panel Data (in [STATA](#) & [SAS](#))

- The dataset from the panel reinterviews of past respondents from the 2016 and 2018 Cross-section GSS Studies. This dataset is most helpful for those seeking person-level changes, particularly changes resulting from: 1) the passage of time, 2) the COVID-19 pandemic, and 3) the shift from face-to-face (FTF) to web self-administered questionnaire (SAQ). The 2016-2020 GSS panel survey was fielded from August 24, 2020, to September 26, 2020.

### [GSS-ANES](#)

- The 2016-2020 GSS Panel Wave 2 includes a collaboration between the GSS and American National Election Studies (ANES), which was planned before the COVID-19 pandemic and was extensively modified in light of delays in data collection. The 2016-2020 GSS Panel Wave 2 interview contained a module of items drawn from the ANES, including attitudes on several issues, feeling thermometers for the presidential candidates, and plans for voting in the 2020 presidential election. Following the completion of the 2016-2020 GSS Panel Wave 2 in September 2020, all respondents who: 1) were U.S. citizens, 2) could be located within U.S. voting districts, and 3) completed the ANES module were eligible and were contacted to complete the 2020 ANES postelection survey. Any eligible citizen who completed both surveys (i.e., Wave 2 GSS survey and the ANES follow-up questionnaire) can be linked with a key, which will be available in the future. For more information, please see the [ANES-GSS 2020 Joint Study User Guide and Codebook](#).

### [GSS Codebook](#)

- This is the legacy codebook that combines all of the notes, appendices, and frequency tables of the GSS since its inception in 1972 up through 2018: [https://gss.norc.umd.edu/content/dam/gss/get-documentation/pdf/codebook/GSS\\_Codebook.zip](https://gss.norc.umd.edu/content/dam/gss/get-documentation/pdf/codebook/GSS_Codebook.zip). This is useful to see how trends have changed over the decades, find question-level wording, and find when questions were added or discontinued.
- The [2021 GSS Codebook](#) contains the notes, appendices, and frequency tables for the 2021 GSS Cross-section. It contains the fullest discussion of how the GSS managed a rapid transition to a web mode of administration.
- The [2022 GSS Codebook](#) contains the notes, appendices, and frequency tables for the 2022 GSS Cross-section. It contains an expanded discussion on the transition from the web mode administration of 2021 to the multimode experimental design tested in 2022.

### [GSS Data Explorer](#)

- A web-based interactive tool to access and analyze GSS data, question wording, and historical trends: <https://gssdataexplorer.norc.umd.edu/>. The Data Explorer is helpful to visualize individual variables' trend lines or extract data into various software packages. As of December 2021, the Data Explorer is on its 2.0 release, and users with accounts from 1.0 may have to recreate previous analysis.

### [GSS Panel \(2006-2014\) Release Notes](#) and Datasets (in [SPSS](#) & [STATA](#))

- In 2006 the GSS started a transition from a replicating cross-sectional design to a design that uses rotating panels. By 2008, there were two components: a new 2008 cross-section with 2,023 cases and the first reinterviews with 1,536 respondents from the 2006 GSS. In 2010 the new design was fully implemented. There was a new cross-section of 2,044 cases, the first reinterviews of the 2008 GSS respondents, and the

second and final reinterviews of the 2006 GSS respondents. This three-wave, rolling panel design was also used in 2012. Each GSS in 2006–2010 thus started a new four-year/three-wave panel, which was completed four years later (2006-08-10, 2008-10-12, 2010-12-14). However, in 2012 no new three-wave panel was started. The table below shows the design of how the various panels overlapped in time but not participants.

*Table D1: GSS Design Features: Cross-sectional and Panel Components*

| Panel Wave           | 2006  | 2008  | 2010  | 2012  | 2014  |
|----------------------|-------|-------|-------|-------|-------|
| 1 <sup>st</sup> wave | 4,510 | 2,023 | 2,044 |       |       |
| 2 <sup>nd</sup> wave |       | 1,536 | 1,581 | 1,551 |       |
| 3 <sup>rd</sup> wave |       |       | 1,276 | 1,295 | 1,304 |
| Combined N           | 4,510 | 3,559 | 4,901 | 4,820 | 3,847 |

### [National Congregations Study \(NCS\)](#)

- In the 1998, 2006, 2012, and 2018 GSS, respondents who attend religious services were asked to name their religious congregation. A variety of information about each congregation was gathered from the interview with a key informant at each congregation in 1998 and 2006–2007. A third round based on the 2012 GSS was conducted in 2012. A fourth round based on the 2018 GSS was conducted in 2018. These studies were administered by NORC, having Mark Chaves as Principal Investigator of the NCS. More information is available from the [National Congregations Study](#) website.

### [National Organizations Survey \(NOS\)](#)

- In the 1991 GSS, the survey collected the name and contact information of the employer of the respondent and their spouse. Arne L. Kalleberg, David Knoke, Peter V. Marsden, and Joe L. Spaeth carried out a follow-up study of these employers, producing the first wave of the National Organizations Survey (NOS). The NOS has 727 cases that consist of a) information on the employer, b) information about the GSS respondent and/or spouse employed by the employer, and c) aggregate industry-level information. The second wave of NOS (n=516) was collected in 2002 based on the 2002 GSS respondents. Both files are available from [ICPSR](#).

### GSS-National Death Index (NDI)

- The National Death Index (NDI) is a database of all the deaths in the United States. The NDI allows investigators to determine whether persons in their studies have died by providing: 1) names of the state in which those deaths occurred, 2) dates of death, 3) corresponding death certificate numbers, and 4) causes of death. In the 2009–2010, GSS respondents from 1978 to 2002 were linked to the NDI. This study was carried out by Peter Muennig, Columbia University. This study was later expanded to include GSS respondents through 2010 determining whether they had died as of 2014. The indicator of possible vital status as of 2014 (variable name: DEATH) is now part of the downloadable GSS data. Recent changes in

the National Center for Health Statistics (NCHS) protocol regarding NDI no longer allows us to share NDI data through our current sensitive data procedures.

## APPENDIX E: Disclosure Limitation Variable Response Changes

As discussed in [Disclosure Review and Limitation](#), Table E1 includes a list of all variables, as of R1, where revised response categories have been released either reverting responses to the originally offered response categories or coarsened response ranges. The historically released responses (see column “1972-2022 Release Responses”) are retained in the data as the variable name along with a standard suffix format of \_XXYY, where XX represents the last two digits of the first year that the variable was active, and YY represents the last two digits of the last year that variable was active (e.g., EARNRS\_7222, HISPANIC\_0022). The default variable names will have the responses reported in column “2024 Release Responses.”

*Table E1: Variables Coarsened as of the 2024 GSS to Address Disclosure Limitation*

| Variable / Preserved Variable                                                            | Question                                                                                                                           | 1972-2022 Release Responses |                                  | 2024 Release Responses |                                             |
|------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|----------------------------------|------------------------|---------------------------------------------|
|                                                                                          |                                                                                                                                    | Value                       | Label                            | Value                  | Label                                       |
| EARNRS / EARNRS_7222                                                                     | How many persons in the family, including yourself, earned any money last year - [the previous year] - from any job or employment? | 0                           | 0                                | 0                      | 0                                           |
|                                                                                          |                                                                                                                                    | 1                           | 1                                | 1                      | 1                                           |
|                                                                                          |                                                                                                                                    | 2                           | 2                                | 2                      | 2                                           |
|                                                                                          |                                                                                                                                    | 3                           | 3                                | 3                      | 3 or more                                   |

**Variable: NUMEMPS    Type: Numeric**

**Label:**

Are/were you self-employed or do/did you work for someone else?

[If 'Self-employed'] Do/did you have any employees?

[If 'Yes'] How many employees do/did you have?

**Notes:** As of 2024,

NUMEMPS has been recoded to ranges of employees.

This has been retroactively applied to all previous years of NUMEMPS.

The original NUMEMPS containing data from 2004 to 2022 has been renamed NUMEMPS\_7522.

If respondents answered 'Self-employed' to the first part but 'No' to the second part, they did not receive the third part of the question.

## **Adult Mental Health Vignettes**

### **VIGVERSN – Adult Mental Health Vignettes**

[VAR: VIGVERSN]

*Next I'm going to describe a person -- lets call him/her (REFER TO NAME IN VIGNETTE). After I read a description of him/her I'll ask you some questions about how you think and feel about him/her. There are no right or wrong answers. I'm only interested in what you think of NAME.*

INTERVIEWER: READ SELECTED VIGNETTE, THEN GIVE VIGNETTE CARD TO R FOR REFERENCE.

Vignette wording:

(Alcohol dependence)

[John/Juan/Mary/Maria] is a [White/African American/Hispanic] [man/woman] with an [eighth grade/high school/college] education. During the last month [John/Juan/Mary/Maria] has started to drink more than his/her usual amount of alcohol. In fact, he/she has noticed that he/she needs to drink twice as much as he/she used to get the same effect. Several times, he/she has tried to cut down, or stop drinking, but he/she can't. Each time he/she has tried to cut down, he/she became very agitated, sweaty and he/she couldn't sleep, so he/she took another drink. His/Her family has complained that he/she is often hungover, and has become unreliable -- making plans one day, and canceling them the next.

(Major depression)

[John/Juan/Mary/Maria] is a [White/African American/Hispanic] [man/woman] with an [eighth grade/high school/college] education. For the past two weeks [John/Juan/Mary/Maria] has been feeling really down. He/She wakes up in the morning with a flat heavy feeling that sticks with him/her all day long. He/She isn't enjoying things the way he/she normally would. In fact nothing gives him/her pleasure. Even when good things happen, they don't seem to make [John/Juan/Mary/Maria] happy. He/She pushes on through his/her days, but it is really hard. The smallest tasks are difficult to accomplish. He/She finds it hard to concentrate on anything. He/She feels out of energy and out of steam. And even though [John/Juan/Mary/Maria] feels tired, when night comes he/she can't go to sleep. [John/Juan/Mary/Maria] feels pretty worthless, and very discouraged. [John's/Juan's/Mary's/Maria's] family has noticed that he/she hasn't been himself/herself for about the last month and that he/she has pulled away from them. [John/Juan/Mary/Maria] just doesn't feel like talking.

## ***Codebook and Unweighted Frequencies for the 2024 General Social Survey (GSS)***

### **(Schizophrenia)**

[John/Juan/Mary/Maria] is a [White/African American/Hispanic] [man/woman] with an [eighth grade/high school/college] education. Up until a year ago, life was pretty okay for [John/Juan/Mary/Maria]. But then, things started to change. He/She thought that people around him/her were making disapproving comments, and talking behind his/her back. [John/Juan/Mary/Maria] was convinced that people were spying on him/her and that they could hear what he/she was thinking. [John/Juan/Mary/Maria] lost his/her drive to participate in his/her usual work and family activities and retreated to his/her home, eventually spending most of his/her day in his/her room. [John/Juan/Mary/Maria] was hearing voices even though no one else was around. These voices told him/her what to do and what to think. He/She has been living this way for six months.

### **(Drug problem)**

[John/Juan/Mary/Maria] is a [White/African American/Hispanic] [man/woman] with an [eighth grade/high school/college] education. A year ago [John/Juan/Mary/Maria] sniffed cocaine for the first time with friends at a party. During the last few months he/she has been snorting it in binges that last several days at a time. He/She has lost weight and often experiences chills when bingeing. [John/Juan/Mary/Maria] has spent his/her savings to buy cocaine. When [John's/Juan's/Mary's/Maria's] friends try to talk about the changes they see, he/she becomes angry and storms out. Friends and family have also noticed missing possessions and suspect [John/Juan/Mary/Maria] has stolen them. He/She has tried to stop snorting cocaine, but can't. Each time he/she tries to stop he/she feels very tired, depressed and unable to sleep. He/She lost his/her job a month ago, after not showing up for work.

### **(No problem)**

[John/Juan/Mary/Maria] is a [White/African American/Hispanic] [man/woman] with an [eighth grade/high school/college] education. Up until a year ago, life was pretty okay for [John/Juan/Mary/Maria]. While nothing much was going wrong in [John's/Juan's/Mary's/Maria's] life he/she sometimes feels worried, a little sad, or has trouble sleeping at night. [John/Juan/Mary/Maria] feels that at times things bother him/her more than they bother other people and that when things go wrong, he/she sometimes gets nervous or annoyed. Otherwise [John/Juan/Mary/Maria] is getting along pretty well. He/She enjoys being with other people and although [John/Juan/Mary/Maria] sometimes argues with his/her family, [John/Juan/Mary/Maria] has been getting along pretty well with his/her family.

**REMARKS:** In 2006, drug problem is not used in vignettes. As a result, no respondent has received vignette number 55-72.

## **Child Mental Health Vignettes**

### **CHLDVIG – Adult Mental Health Vignettes**

[VAR: CHLDVIG]

Vignette text:

Next I'm going to describe a youth -- named (John/Mary). After I read a description of (him/her) I'll ask you some questions about how you think and feel about (him/her).

(ADHD vignette)

INTERVIEWER: READ SELECTED VIGNETTE, THEN GIVE CARD FOR VIGNETTE (CHLDVIG) TO R FOR REFERENCE.

(John/Mary) is a (White/Black), (male/female), (child who is 8/youth who is 14) years old. (John/Mary) has always had trouble in school, especially in completing assignments on time, even though (he/she) has average intelligence. (John/Mary)'s teachers note that (John/Mary) is very distractible, and that they often have to remind (John/Mary) to get back to the task at hand. (John/Mary) is often up and down, out of (his/her) seat, looking out the window, or talking to classmates (John/Mary) does similar things at home. (His/Her) parents notice that (he/she) easily forgets what (he/she)'s supposed to be doing, has trouble getting up in the morning and going to bed at night, and loses things like toys and games. (John/Mary) also has difficulty making and keeping friends.

(Depression vignette)

INTERVIEWER: READ SELECTED VIGNETTE, THEN GIVE CARD FOR VIGNETTE (CHLDVIG) TO R FOR REFERENCE.

(John/Mary) is a (White/Black), (male/female) (child who is 8/youth who is 14) years old. In the last few months, (John/Mary) has been increasingly moody, staying in (his/her) room after school, and seems to have lost interest in (his/her) favorite hobbies and in friends. (John/Mary) says that (he/she) always feels very tired even though (he/she) is sleeping more than normal, and doesn't feel like eating. (John/Mary) has been having trouble concentrating on what (he/she) is doing both in school and at home, and has told (his/her) parents that "I wish I hadn't been born." One of (John/Mary)'s friends has also heard (him/her) talk about committing suicide.

(Normal vignette)

INTERVIEWER: READ SELECTED VIGNETTE, THEN GIVE CARD FOR VIGNETTE (CHLDVIG) TO R FOR REFERENCE.

(John/Mary) is a (White/Black), (male/female) (child who is 8/youth who is 14) years old. (John/Mary) has several friends in (his/her) neighborhood that (he/she) gets together with one or two times per week, and is involved in several hobbies, including sports and music. (John/Mary) usually gets along fairly well with other kids, but occasionally has some problems with needing to have (his/her) own way or go first in games. (John/Mary) is of average intelligence and behaves appropriately at school, although (he/she) tends to be somewhat shy about participating in class. (John/Mary)'s parents note that (he/she) is sometimes moody, but this comes and goes.

## ***Codebook and Unweighted Frequencies for the 2024 General Social Survey (GSS)***

*(Asthma vignette) \*Not asked in 2024 GSS*

*INTERVIEWER: READ SELECTED VIGNETTE, THEN GIVE CARD FOR VIGNETTE (CHLDVIG) TO R FOR REFERENCE.*

*(John/Mary) is a (White/Black), (male/female) (child who is 8/youth who is 14) years old. (John/Mary) has a history of breathing problems. (John/Mary) often has bouts of coughing at night, and doesn't sleep very well. (His/Her) parents and teachers have noticed that these problems seem to be particularly bad during challenging situations, in the spring and fall, and during strenuous sports activities. (John/Mary) used to enjoy playing soccer but recently gave it up because of these problems. (John/Mary) feels badly about (his/her) breathing problems, which seem to be getting worse, and wishes (he/she) could "be just like other kids." (John/Mary) is involved in several hobbies, including sports and activities with several friends.*

New to 2024:

(Classic Depression)

INTERVIEWER: READ SELECTED VIGNETTE, THEN GIVE CARD FOR VIGNETTE (CHLDVIG) TO R FOR REFERENCE.

(John/Mary) is a (White/Black), (male/female) (child who is 8/youth who is 14) years old. In the last few months, (John/Mary) has been increasingly moody, staying in (his/her) room after school, and seems to have lost interest in (his/her) favorite hobbies and in friends. (John/Mary) says that (he/she) always feels very tired even though (he/she) is sleeping more than normal, and doesn't feel like eating. (John/Mary) has been having trouble concentrating on what (he/she) is doing both in school and at home.

(Impulsivity)

INTERVIEWER: READ SELECTED VIGNETTE, THEN GIVE CARD FOR VIGNETTE (CHLDVIG) TO R FOR REFERENCE.

(John/Mary) is a (White/Black), (male/female) (child who is 8/youth who is 14) years old. (John/Mary) did not have an easy childhood but the details are not well known to others. (John/Mary) has some difficulty making new friends, and frequently gets into minor scrapes and arguments with adults in authority and peers. (He/She) is a risk taker which sometimes is an advantage in life, but sometimes (he/she) can act too quickly without thinking about the possible negative consequences to (his/her)self or others. (John/Mary) has a lot of different hobbies, but struggles to stay interested in them for long. (His/Her) teachers have noticed that (John/Mary) often speaks without thinking, and often flies off the handle when the teacher tells (him/her) they got an answer to a question wrong, or when (his/her) parents correct (his/her) for any misbehavior. Recently, (John/Mary) has been feeling distressed because (his/her) only close friend started avoiding him/her.

(Perfectionism)

INTERVIEWER: READ SELECTED VIGNETTE, THEN GIVE CARD FOR VIGNETTE (CHLDVIG) TO R FOR REFERENCE.

(John/Mary) is a (White/Black), (male/female) (child who is 8/youth who is 14) years old. (John/Mary) has always been popular at school – everyone admires (him/her). (He/She) is a class leader, is in the

## ***Codebook and Unweighted Frequencies for the 2024 General Social Survey (GSS)***

gifted program, and everyone thinks (he/she) is the most likely to succeed in adulthood. But recently (John/Mary) has been struggling in school. It started with one bad grade on an important test and went downhill from there. Now (John/Mary) is afraid (he/she) won't be able to get back on track and get into (his/her) dream college. What's worse – everyone still thinks (he/she) are the perfect student because (John/Mary) has been too ashamed to tell (his/her) friends. (He/She)'s also really afraid to tell (his/her) parents – they've always stressed how important achievement is, and (he/she) is afraid to let them down. (He/She) doesn't know what to do, but (his/her) anxiety and stress about managing this on (his/her) own is becoming overwhelming.

**REMARKS:** The asthma vignette was not asked in 2024 (CHLDVIG 25-32). Respondents were presented with 'youth' wording if vignum2 is even, and 'child' if vignum2 is odd.
